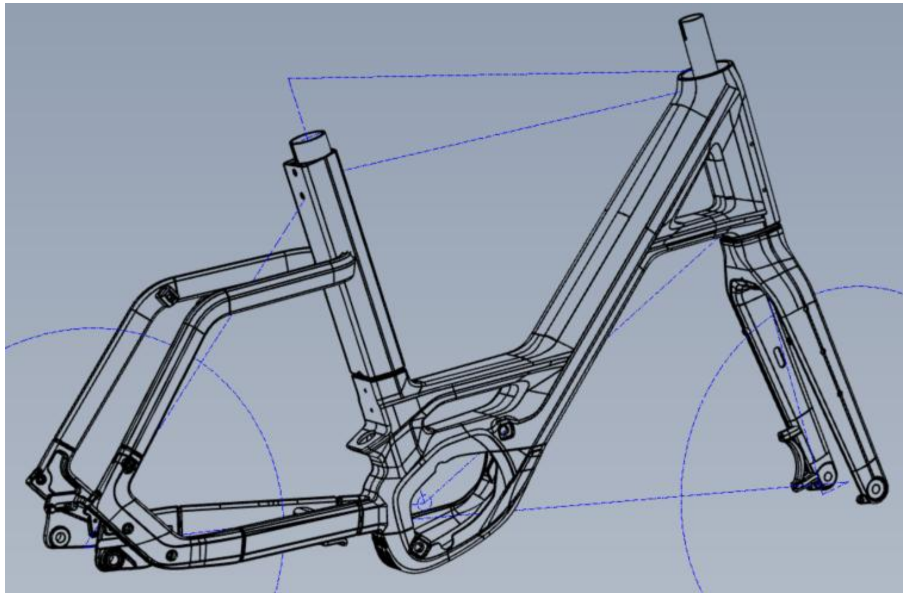
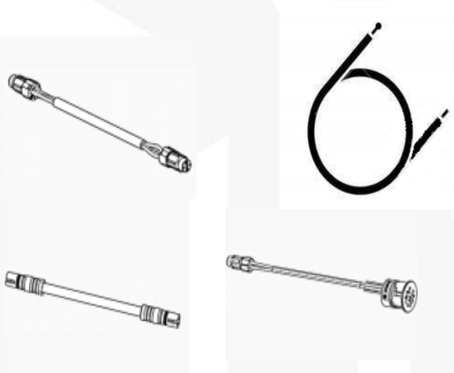
<u>Sequence of the first assembly steps:</u>

1. Route all shift/brake cables and electric cables.

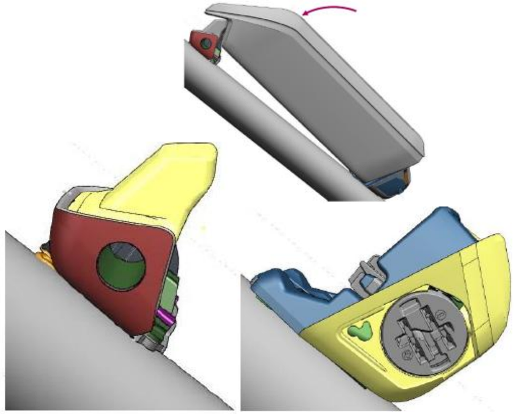
2. Assembly of Batteryholder unit

3. Assembly of Drive Unit





1.



2.

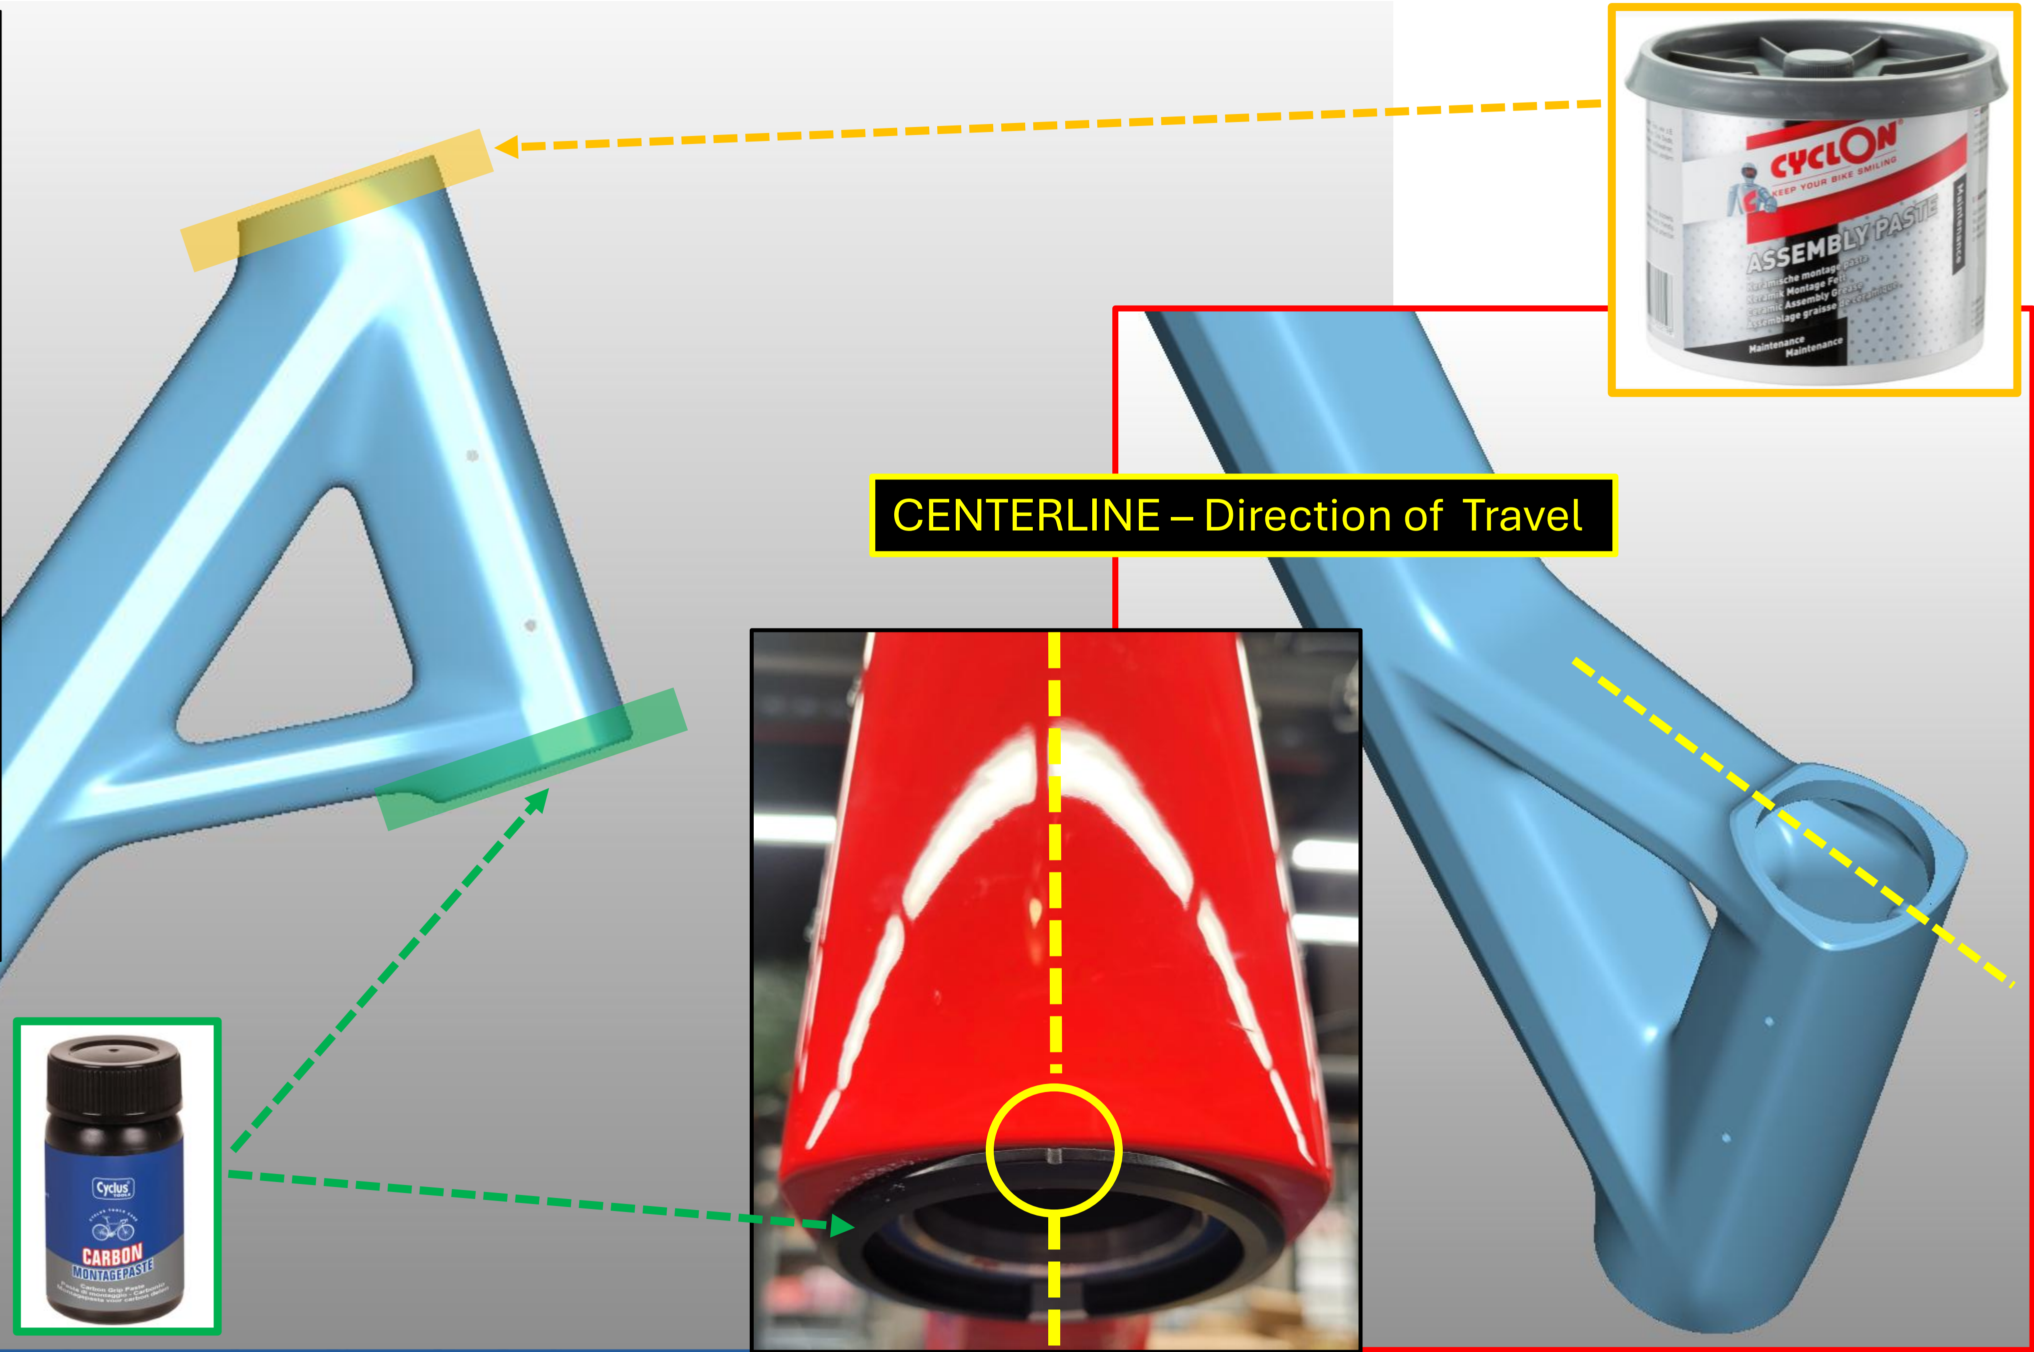
3.

Installation blocklock headset:

It is important that the lower bearing cup is pressed in cleanly in the direction of travel.

For a secure fit of the lower bearing cup, use **Cyclus Tools** assembly paste.

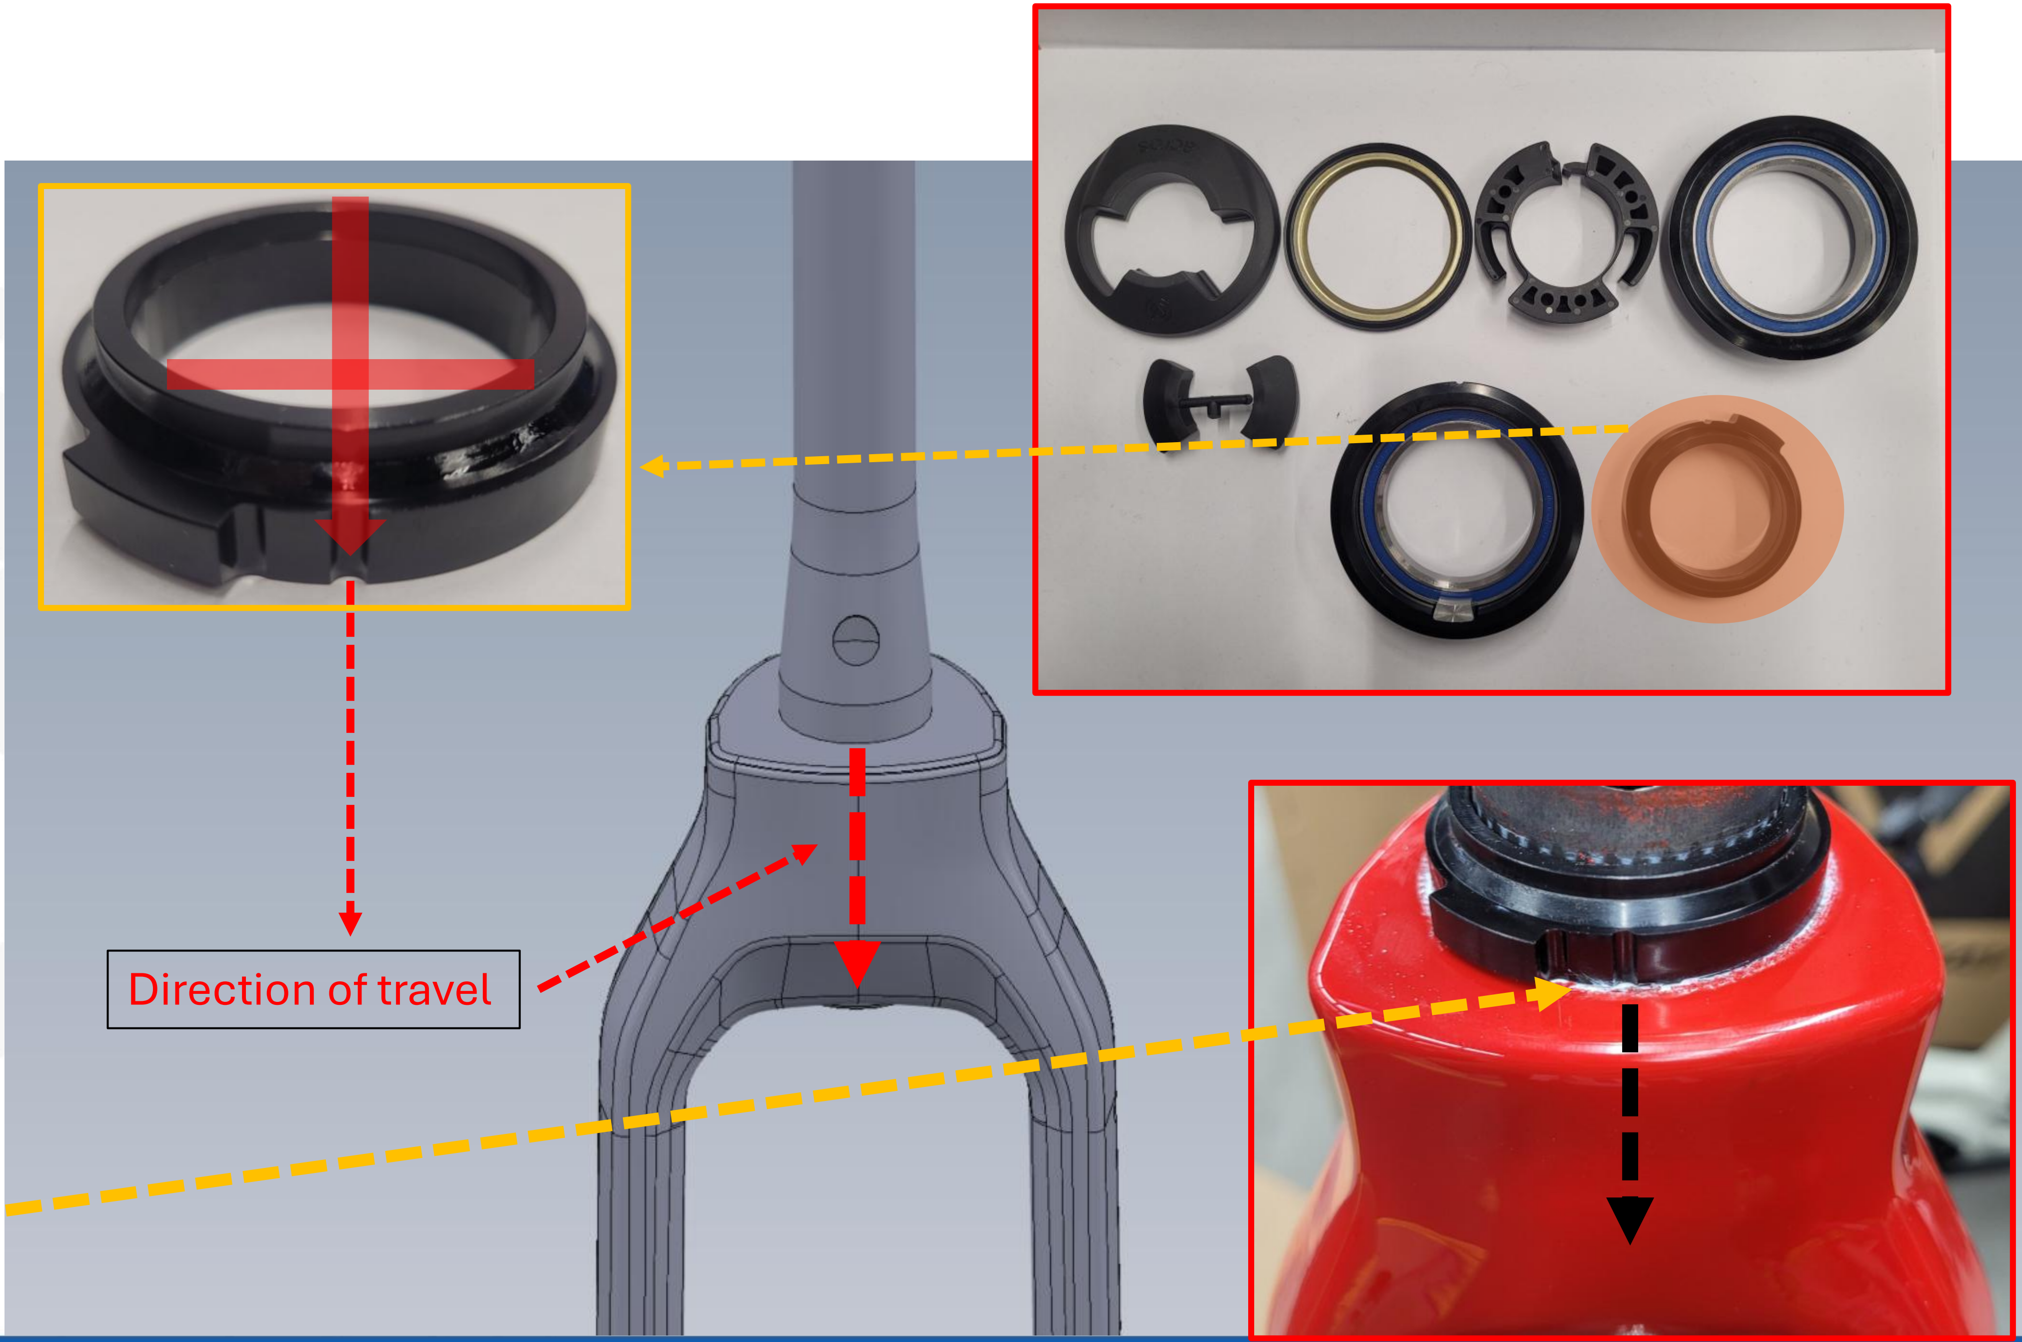
The white grease will be used for the upper bearing cup.



Installation blocklock headset:

It is important to align the blocklock precisely in the direction of travel.

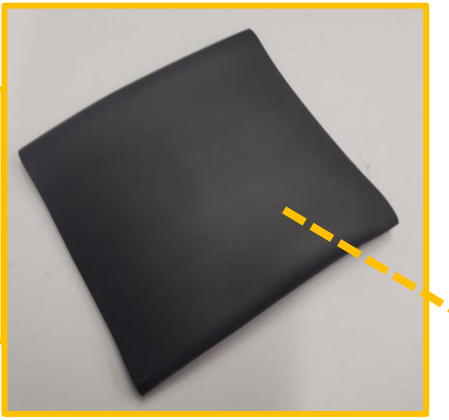
Use sufficient grease for assembly.

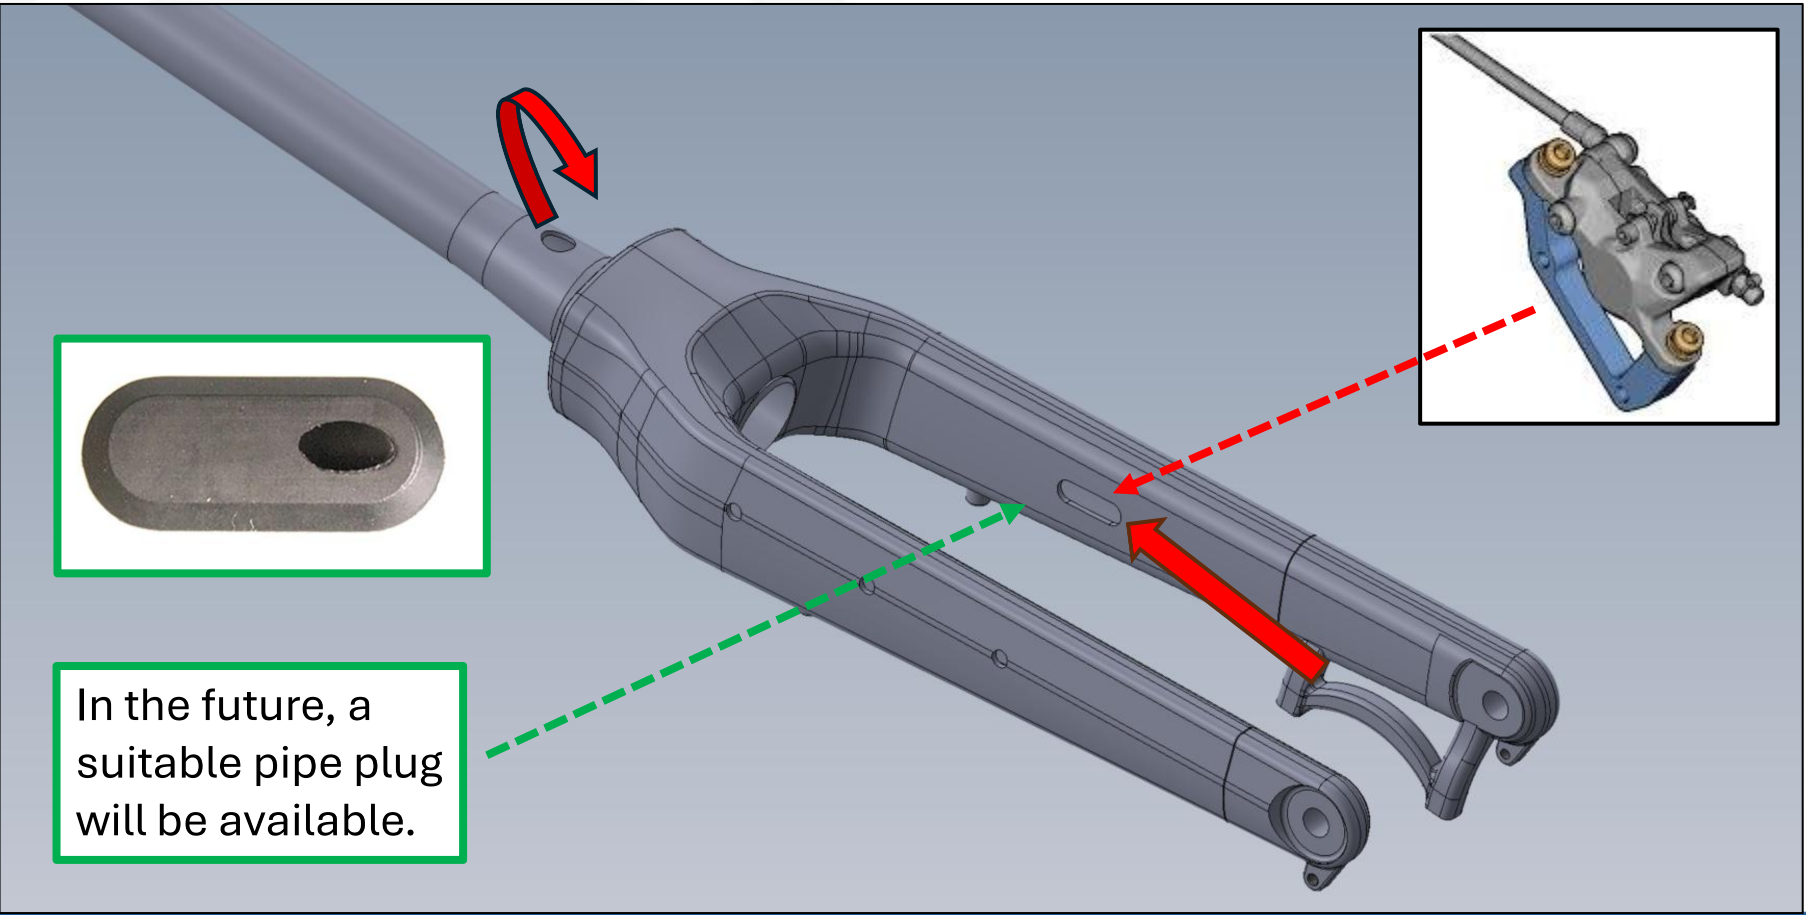


Fork Assembly:

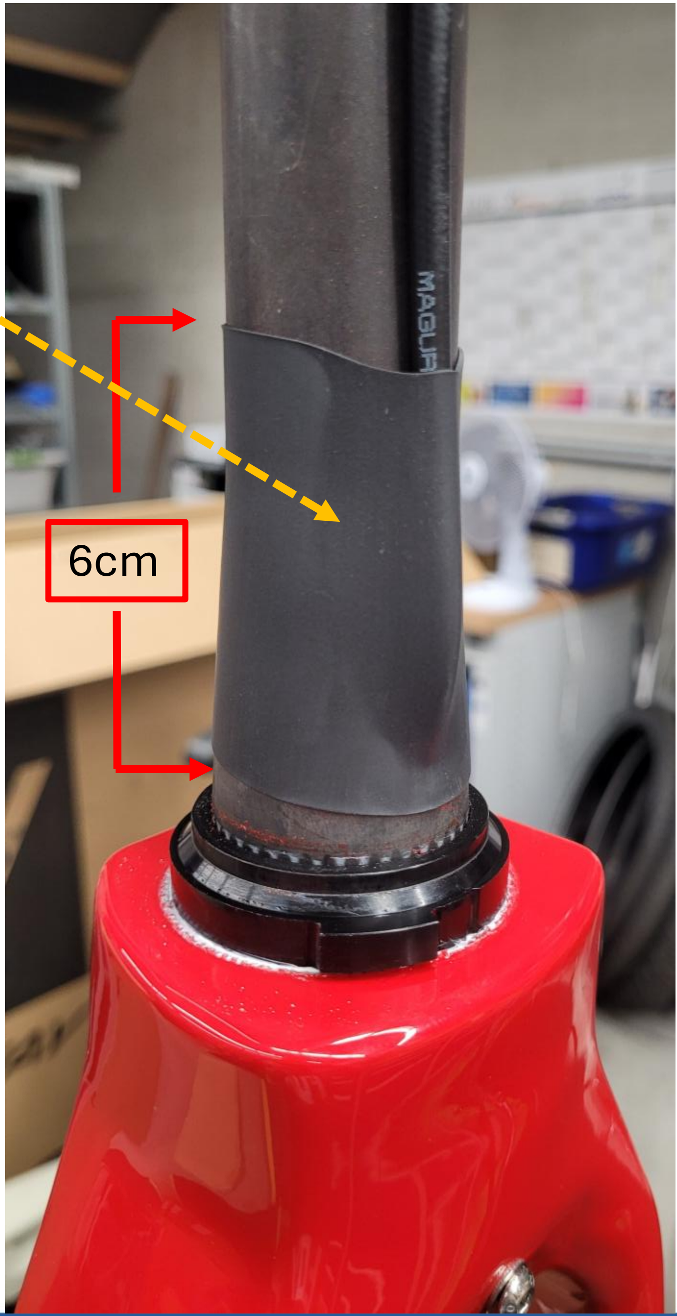
After the brake line has been routed through the fork, the brake line is fixed to the fork with heat shrink tubing.

WÜRTH:
Thin Wall Heat Shrink Tubing 39.0/13.0mm





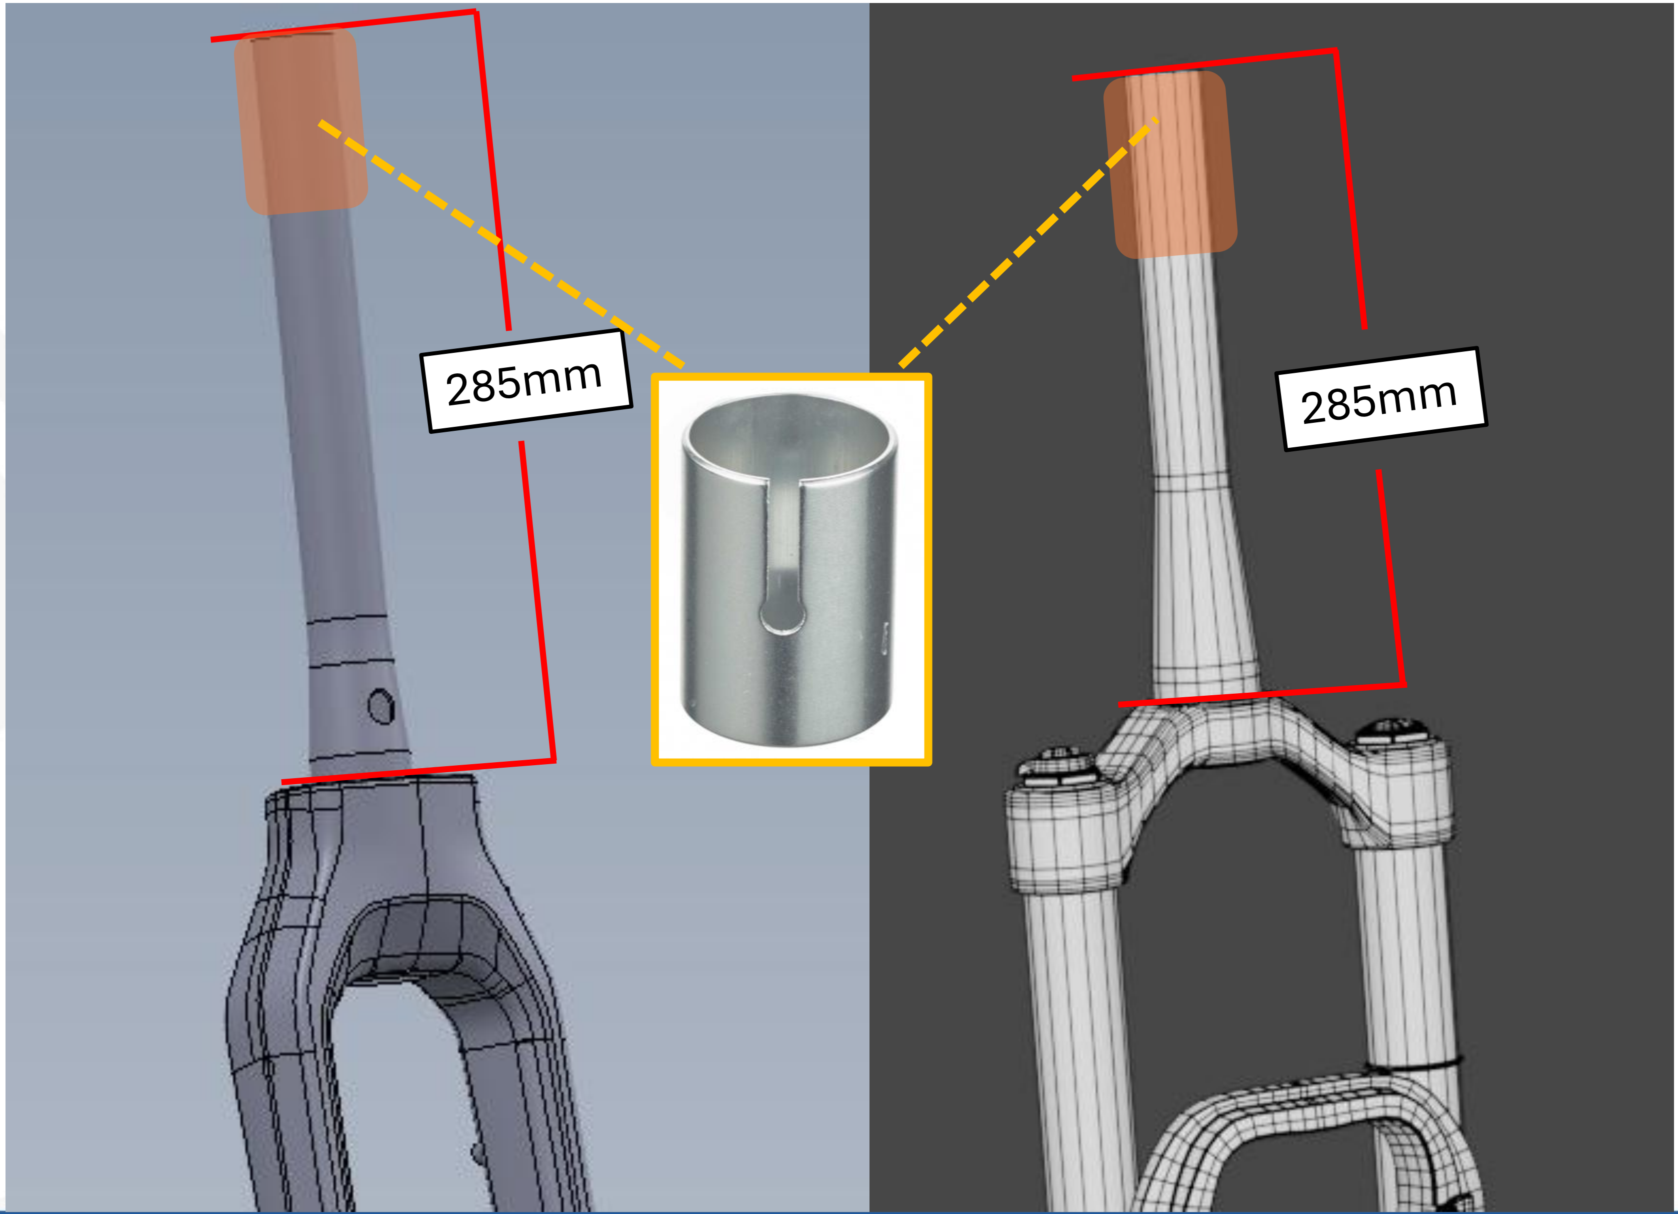
In the future, a suitable pipe plug will be available.



Fork Assembly:

The steerer tube length for both fork types is 285 mm.

If this is not the case, the steerer tube must be shortened and the punch mark renewed using the appropriate tool.

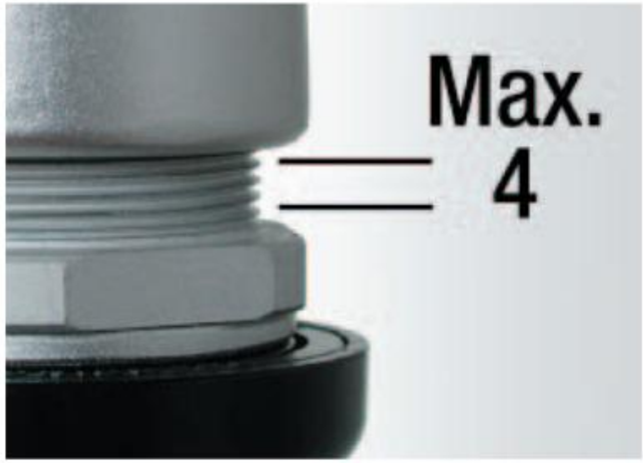


Fork Assembly:

Only 2 spacers should be used when mounting the fork.

With the correct fork shaft length and the correct number of spacers used, the end of the fork shaft should be visible in the opening of the Speed Lifter.

When installed correctly, only 4 threads should be visible.



2 Spacer

Upper edge of fork

Fork Assembly:

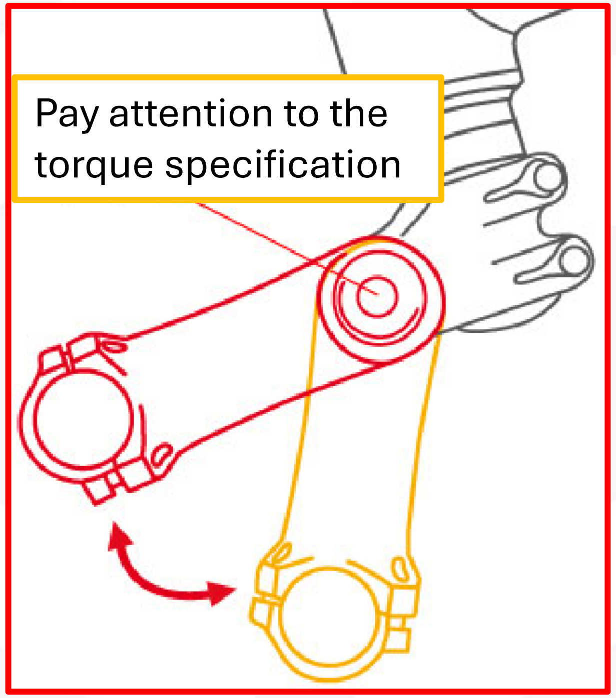
When assembling the steering bearing, it is essential to ensure that all cables are laid neatly and that there are no crossings.

Use some white grease for the assembly.

Cable lengths:

Speedlifter fully extended.
Cables run cleanly and in a slight curve. Both sides of the cables should be approximately symmetrical as shown.

The cables must be cut to length with the stem in its highest position.



Pay attention to the torque specification

Always use bundle spirals for clean installation of all cables.

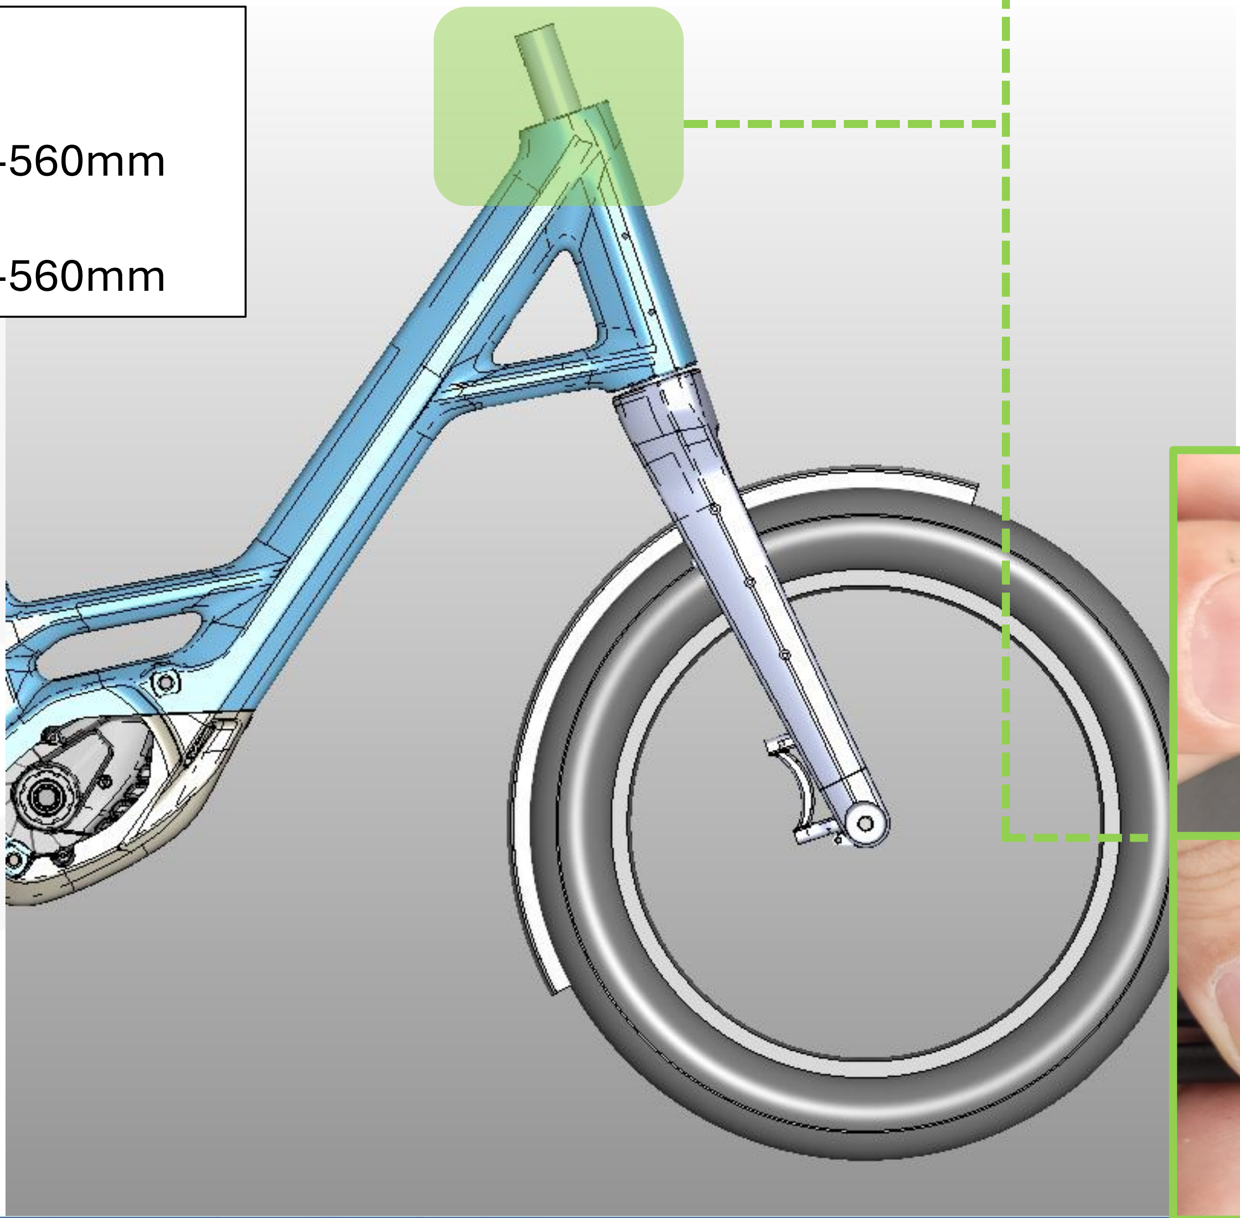
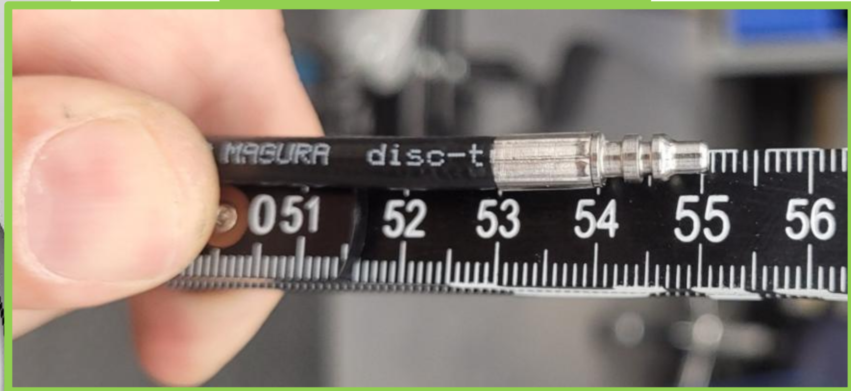
Rear Brake: 550-560mm

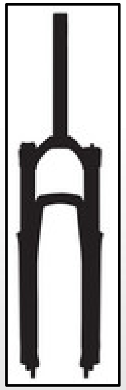




Brake cable

Front brake: 1160mm
1170mm

Rear Brake: 1600mm

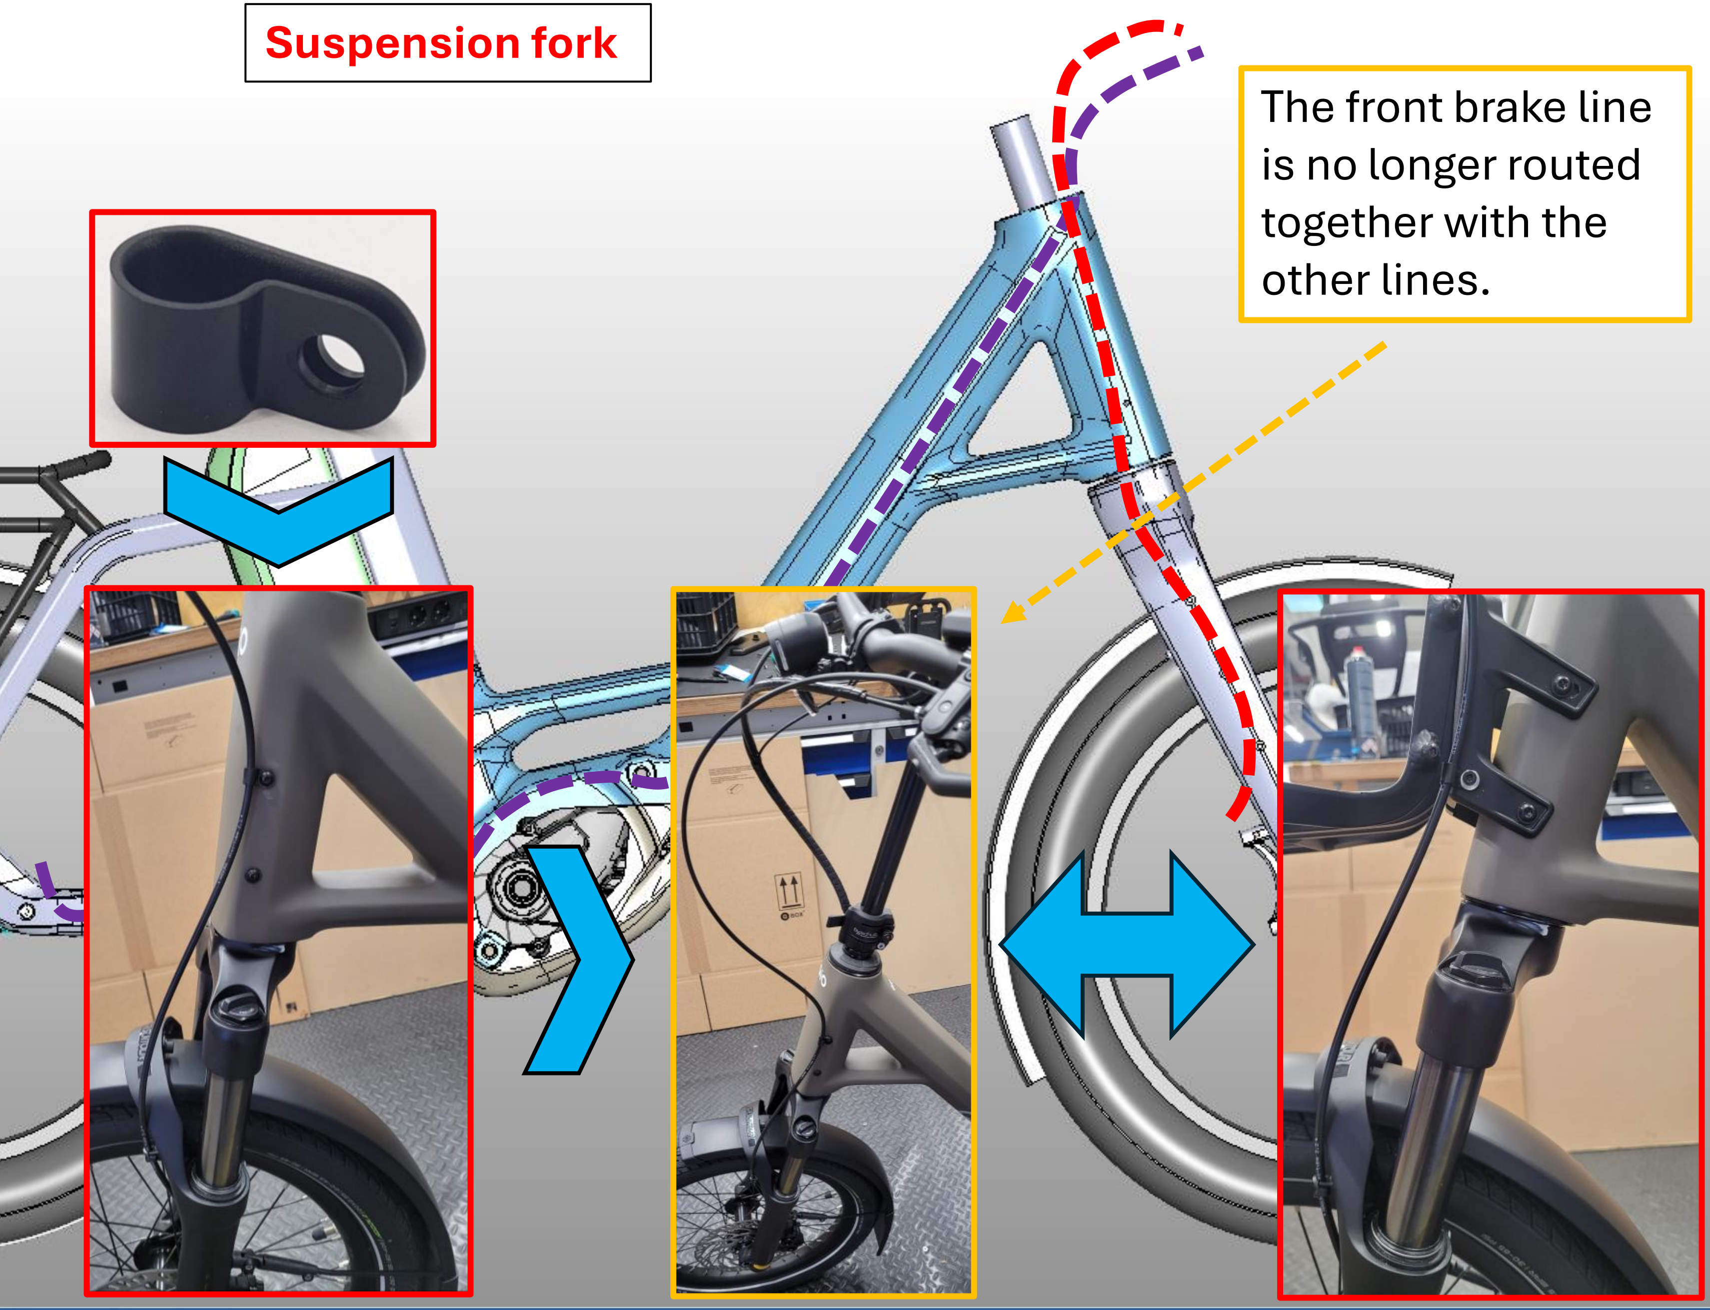


The front wheel brake is attached to the frame with a P-clamp, as shown in the illustrations.

The clamp has a diameter of 6 mm to allow the line to move freely.

The length of the line is necessary to ensure that it remains free to move when additional attachments are used.

Suspension fork

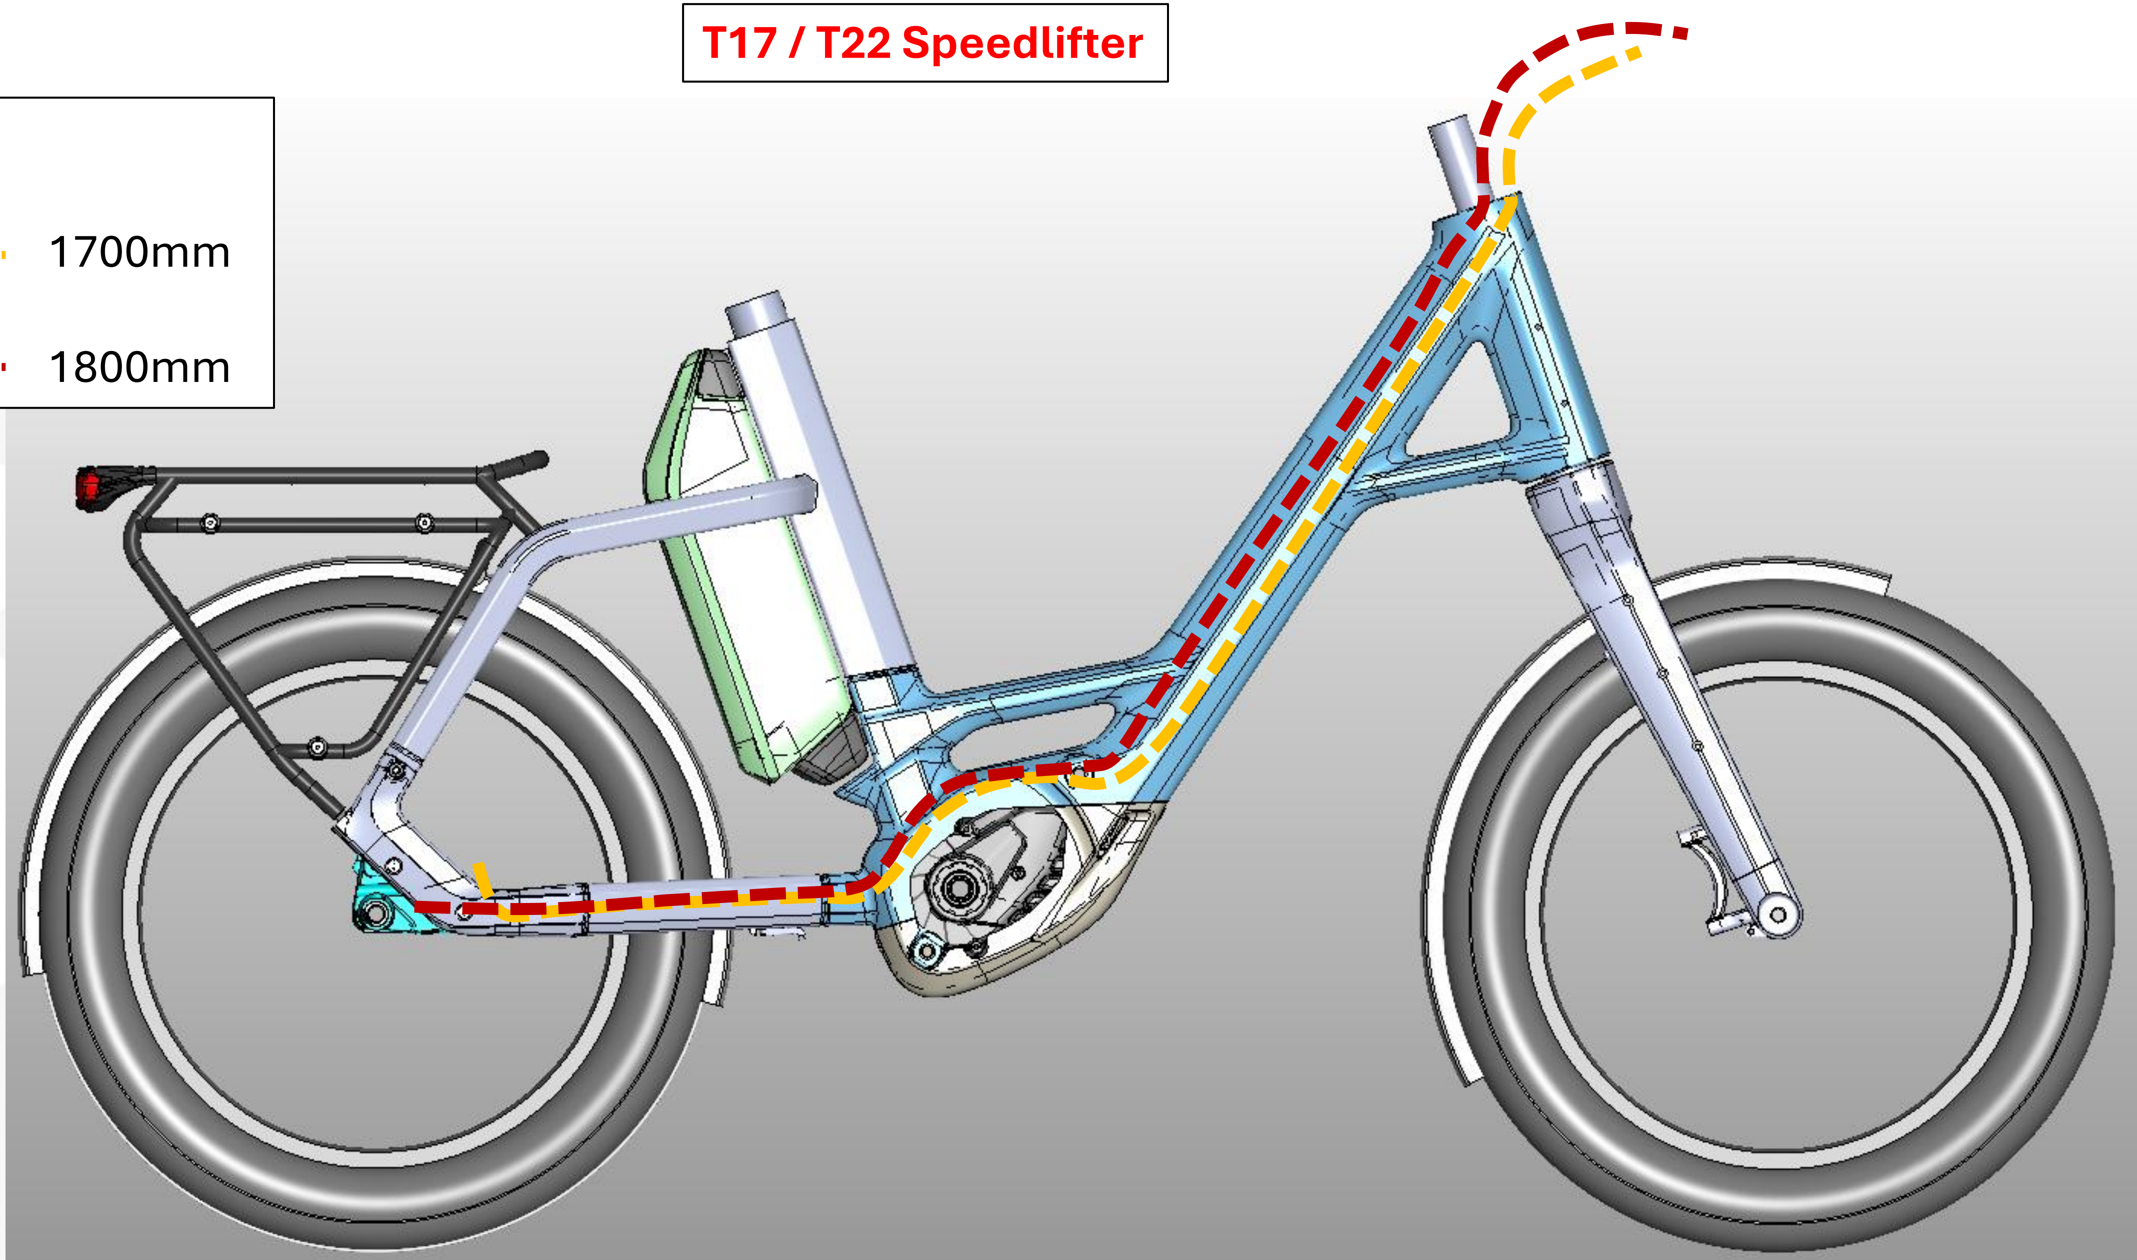


The front brake line is no longer routed together with the other lines.

T17 / T22 Speedlifter

Shift cable

Shimano:	▪▪▪▪▪▪	1700mm
Enviolo:	▪▪▪▪▪▪	1800mm



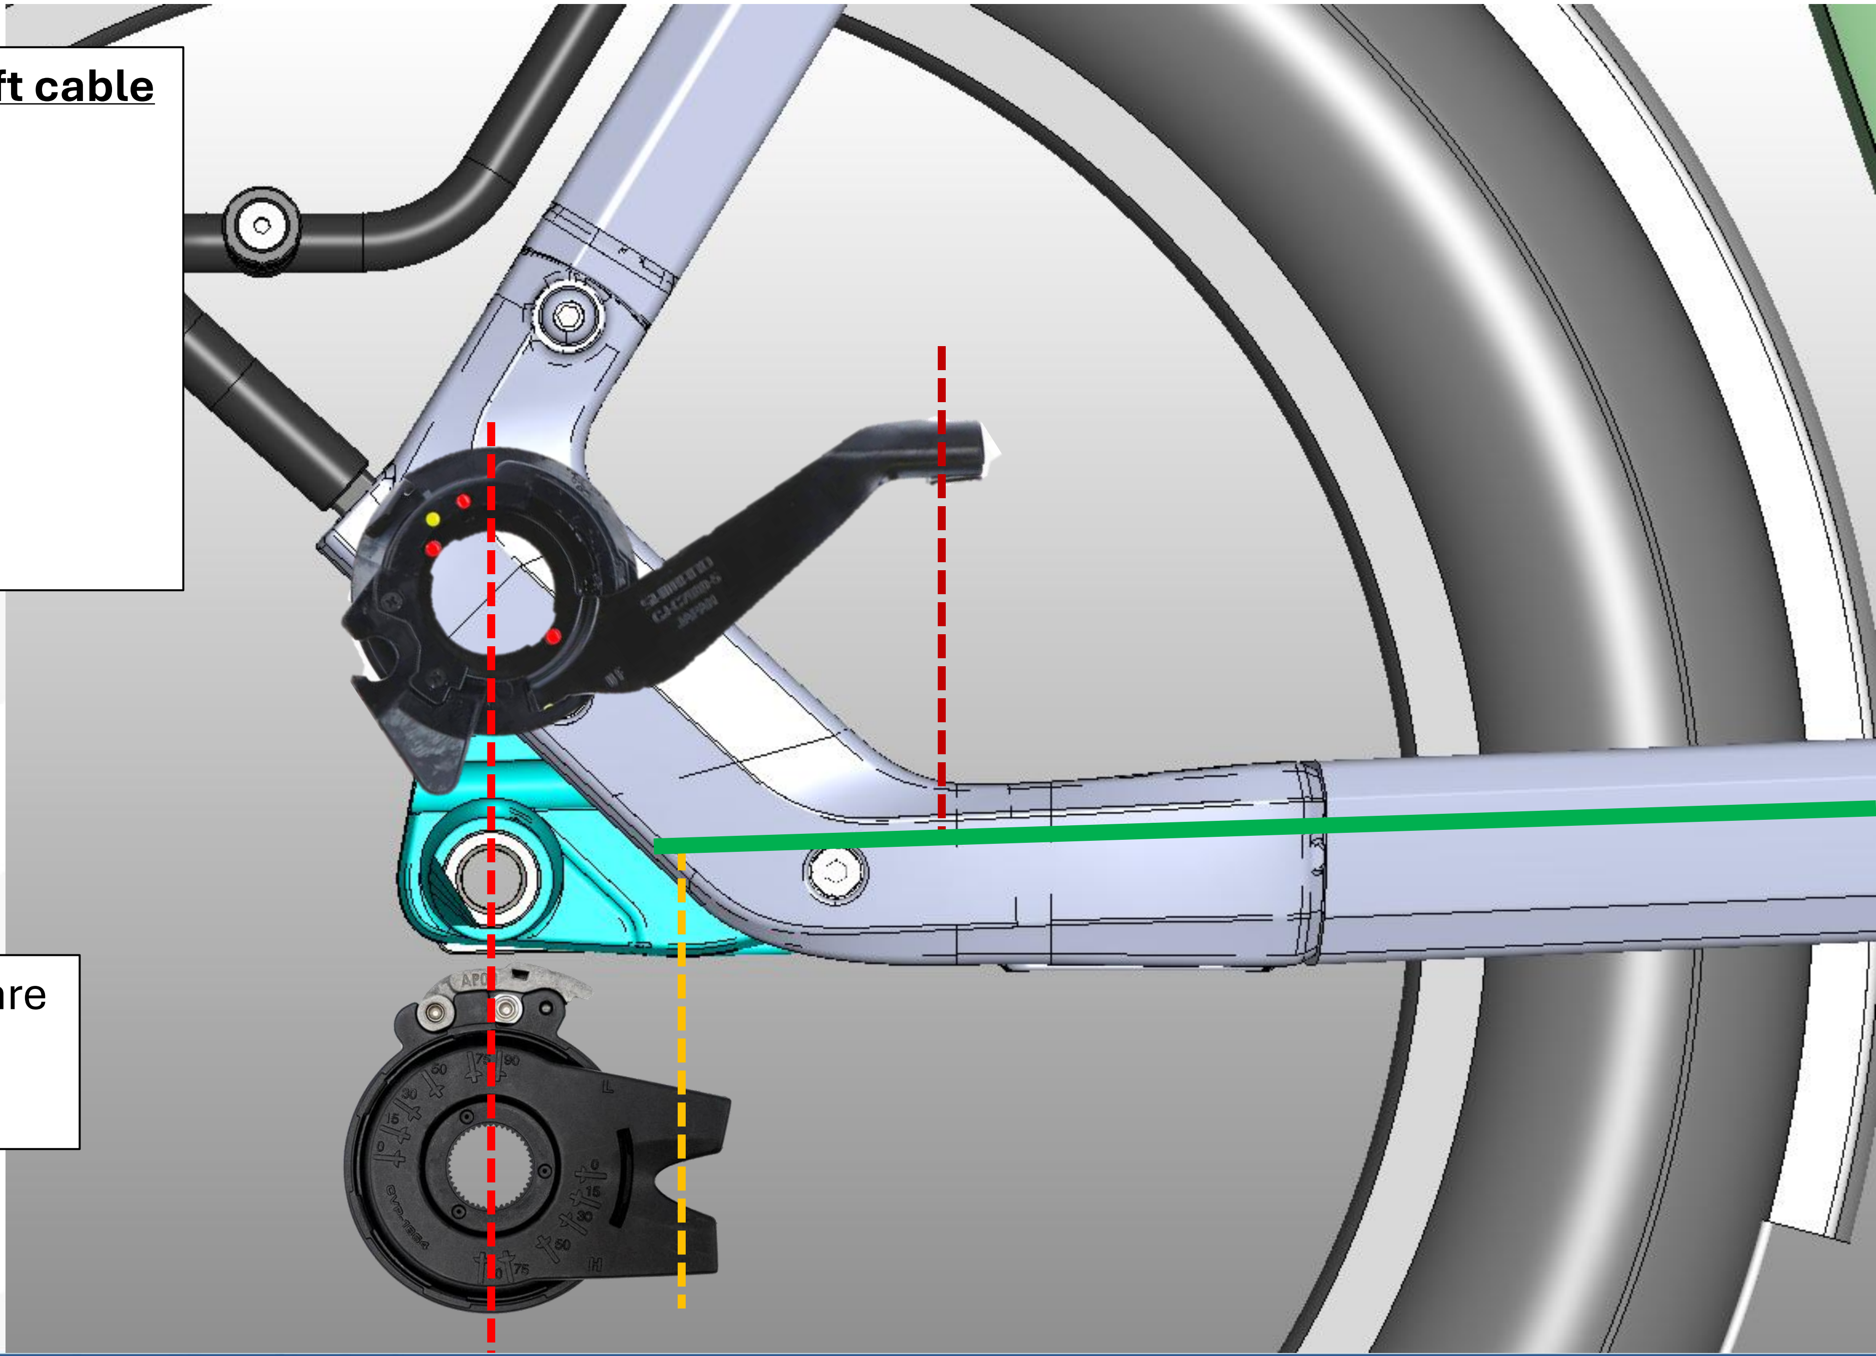
Attachment points for the shift cable

Centerline:

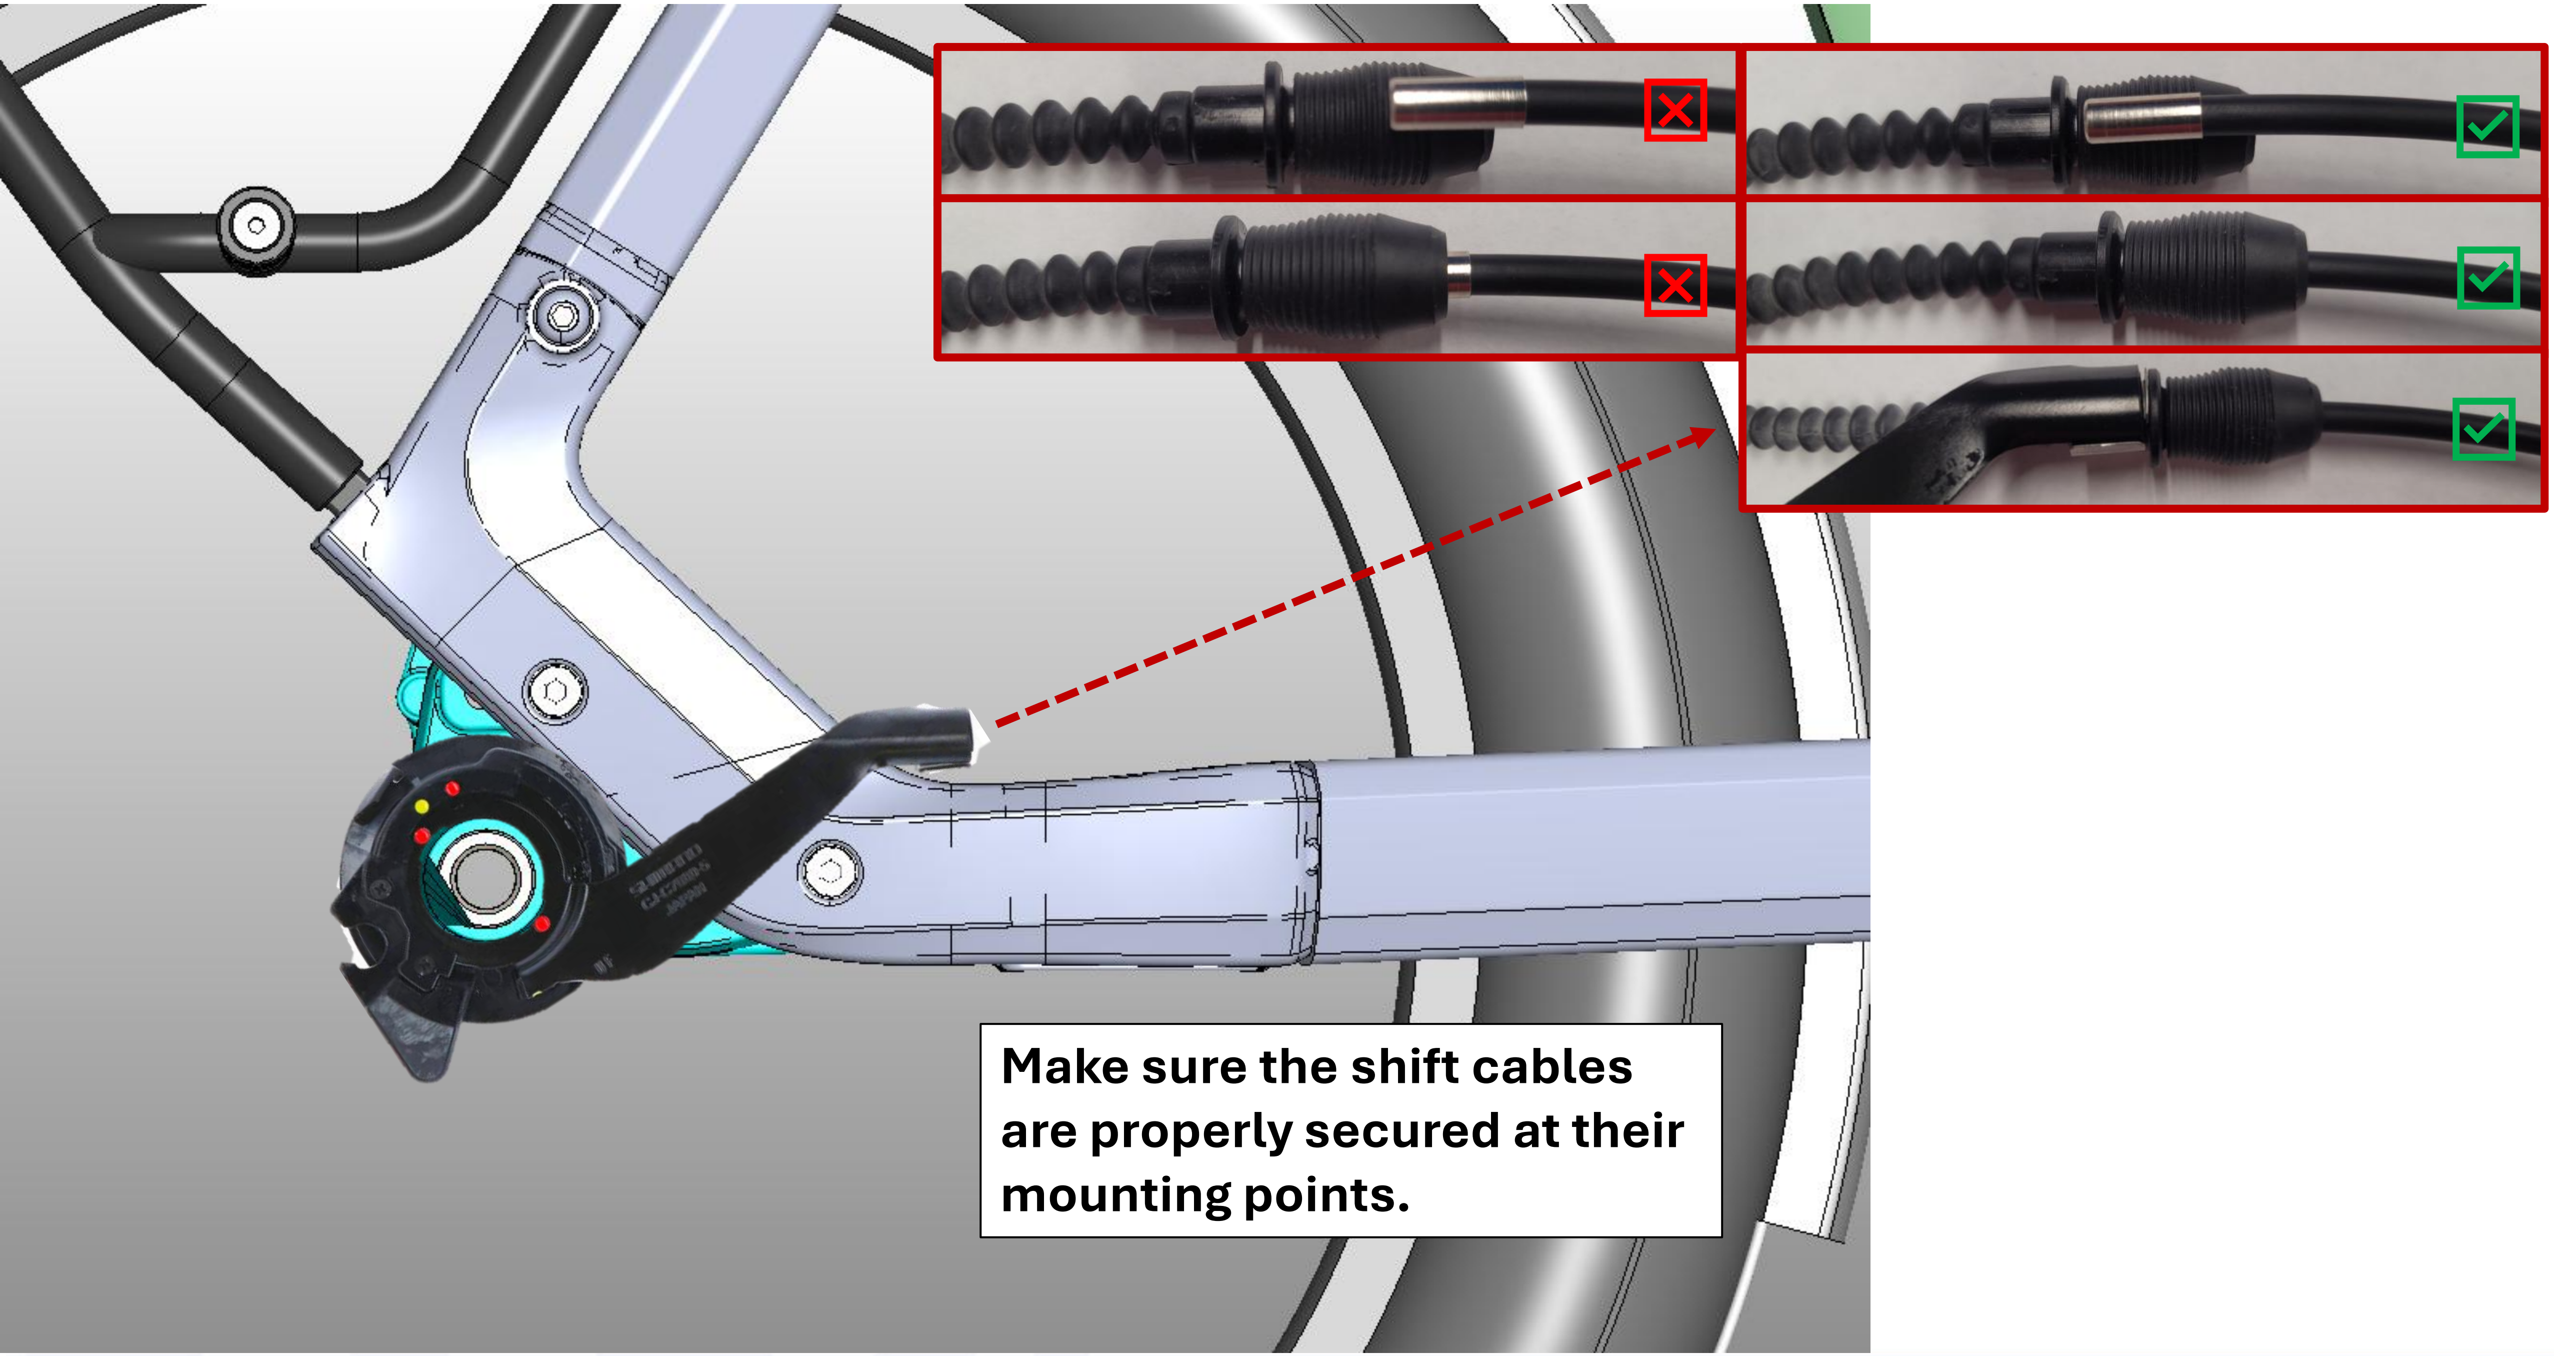
Shimano:

Enviolo:

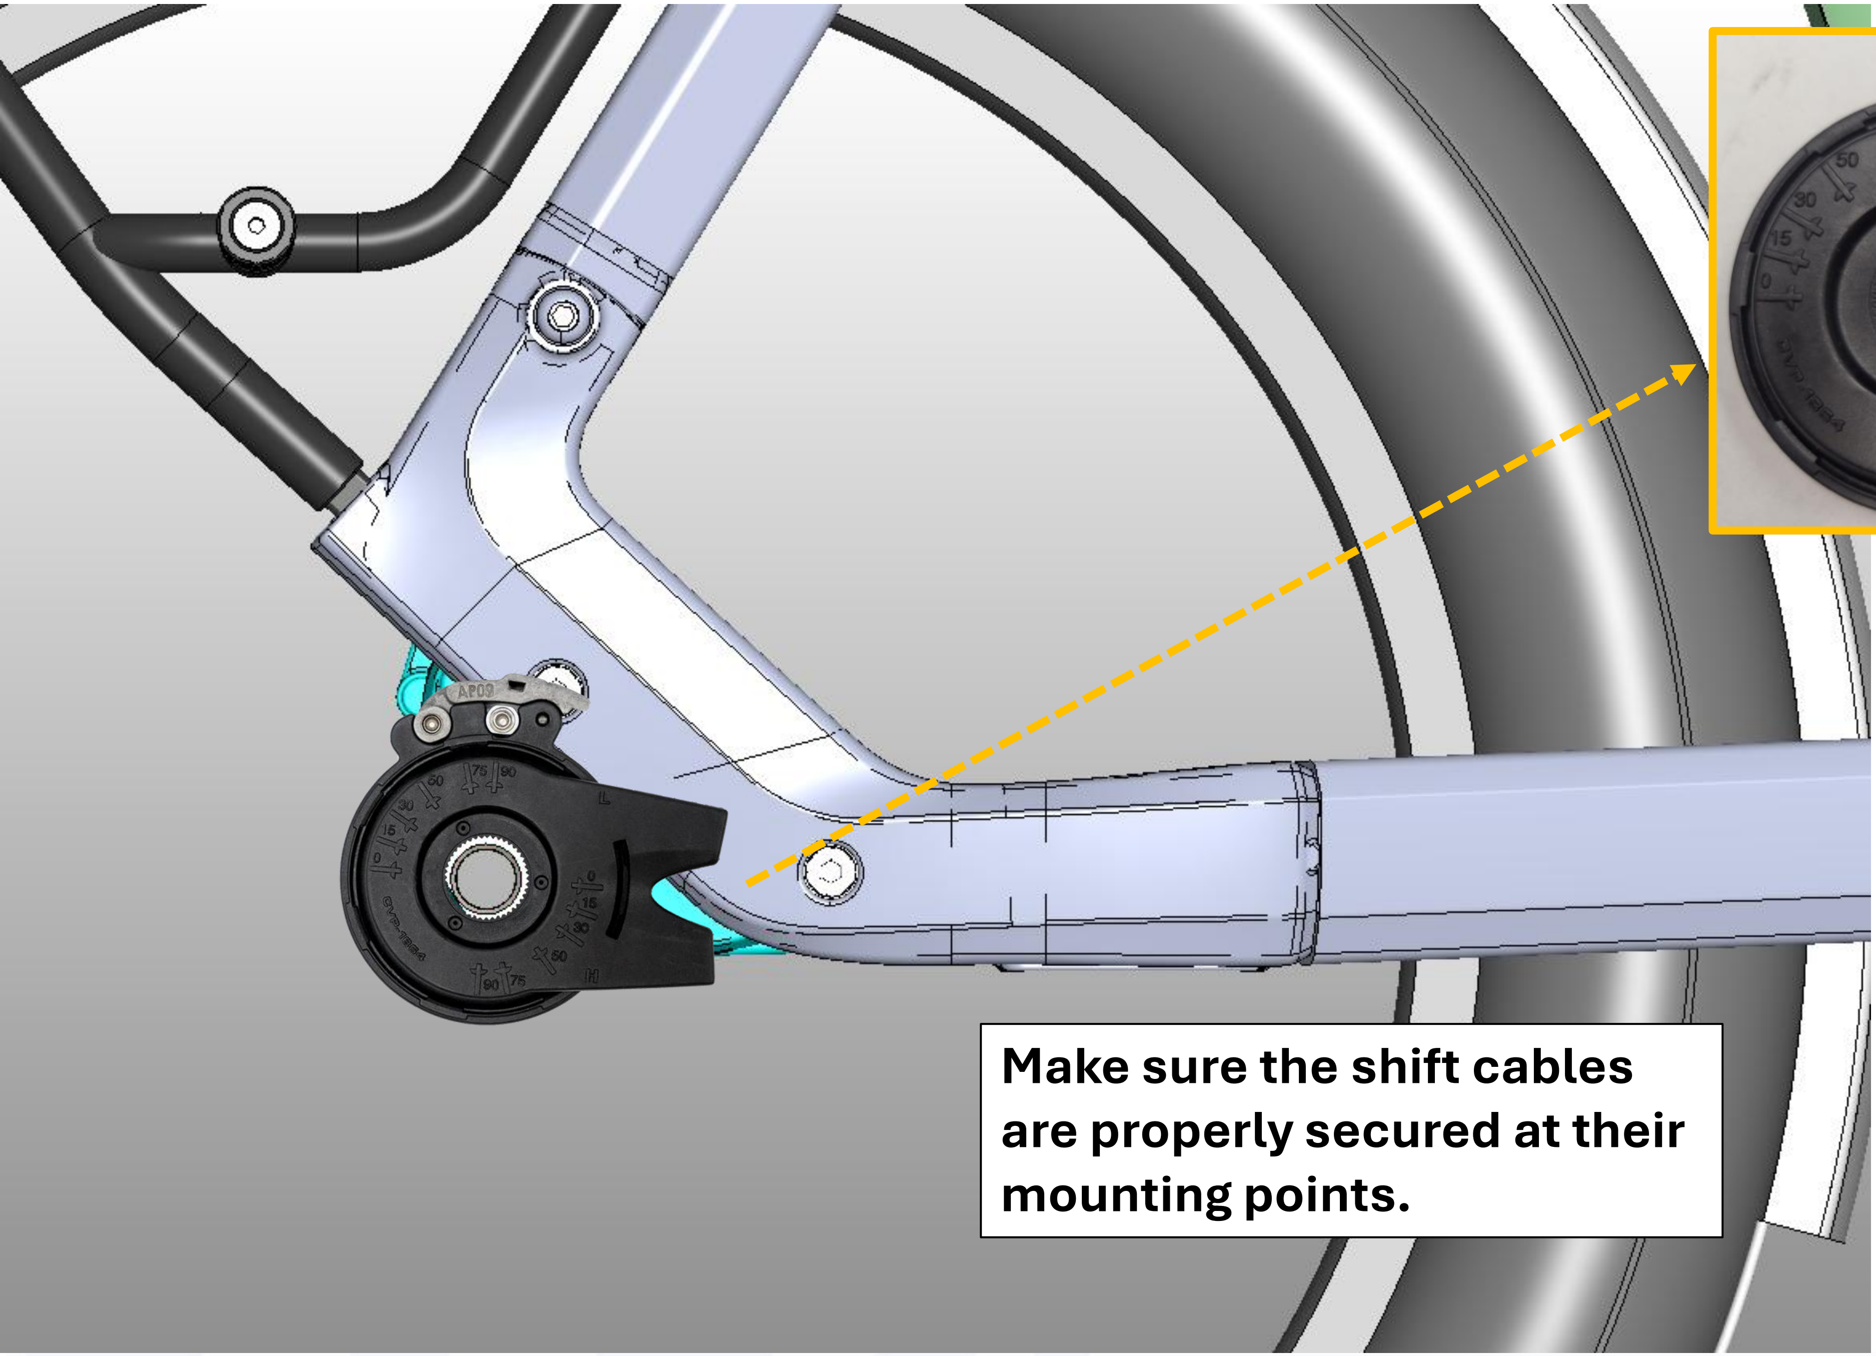
Shift cable:

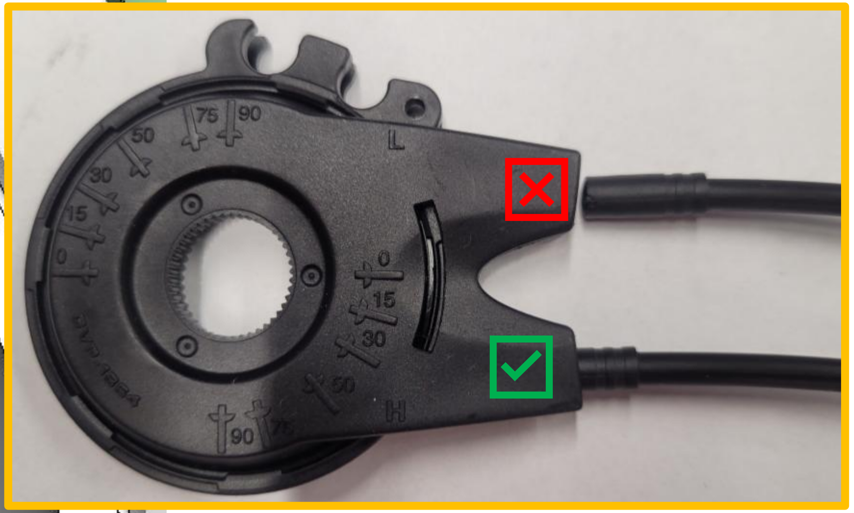


The lengths of the shift cables are chosen so that they need to be shortened as little as possible.



Make sure the shift cables are properly secured at their mounting points.



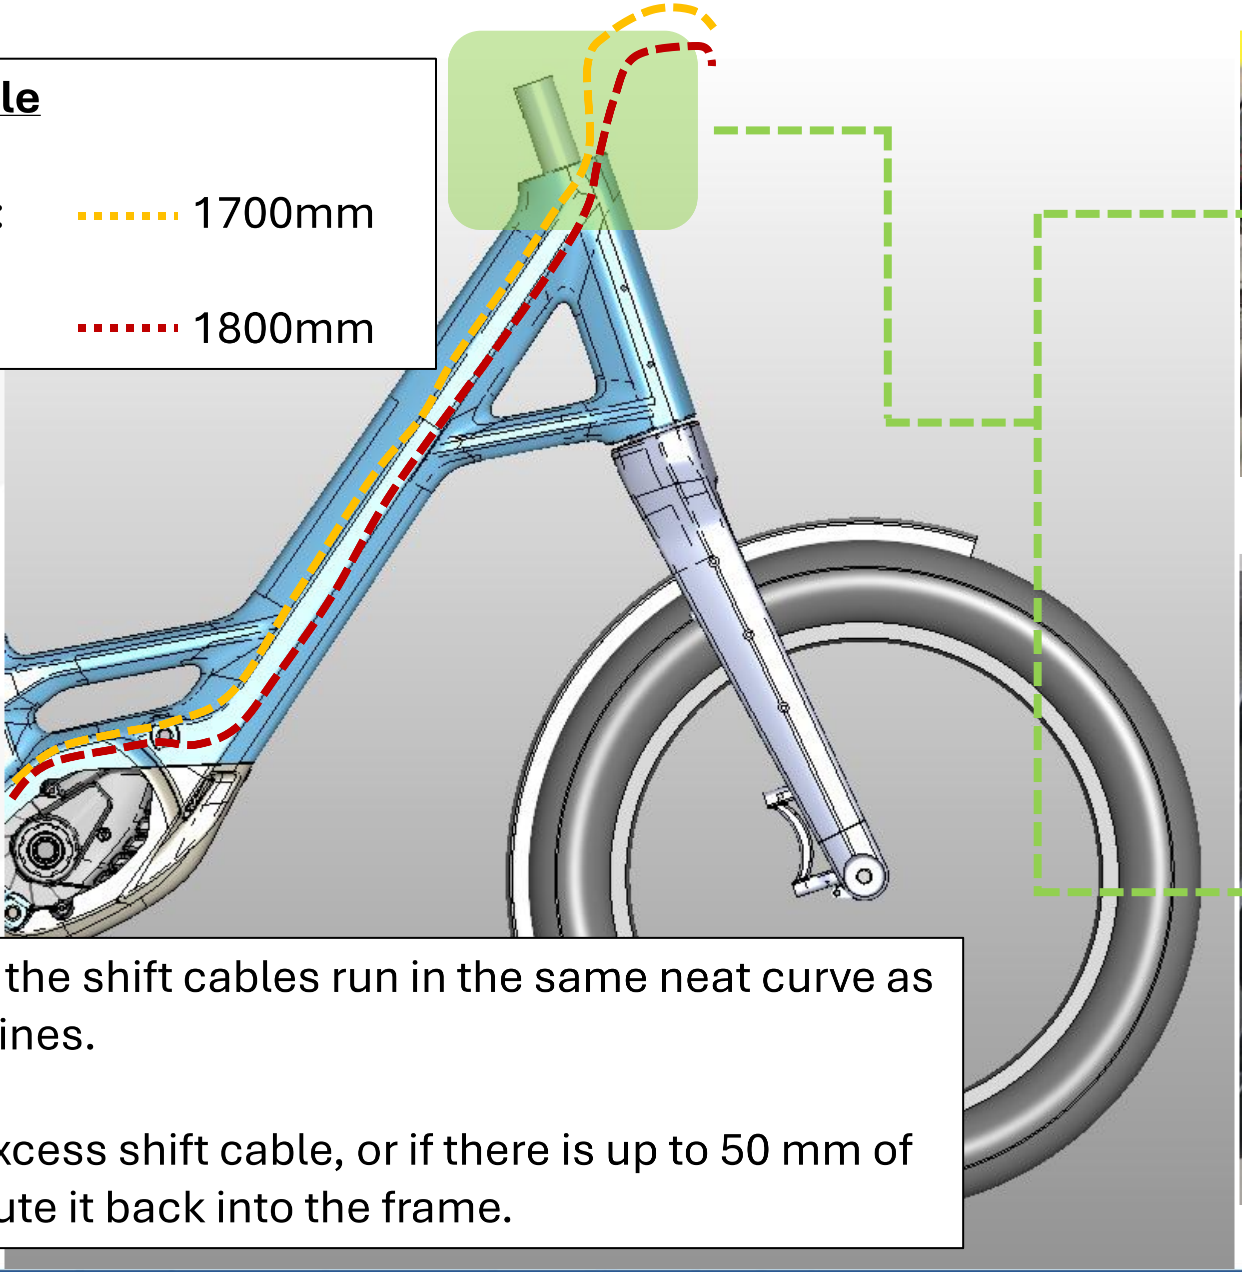


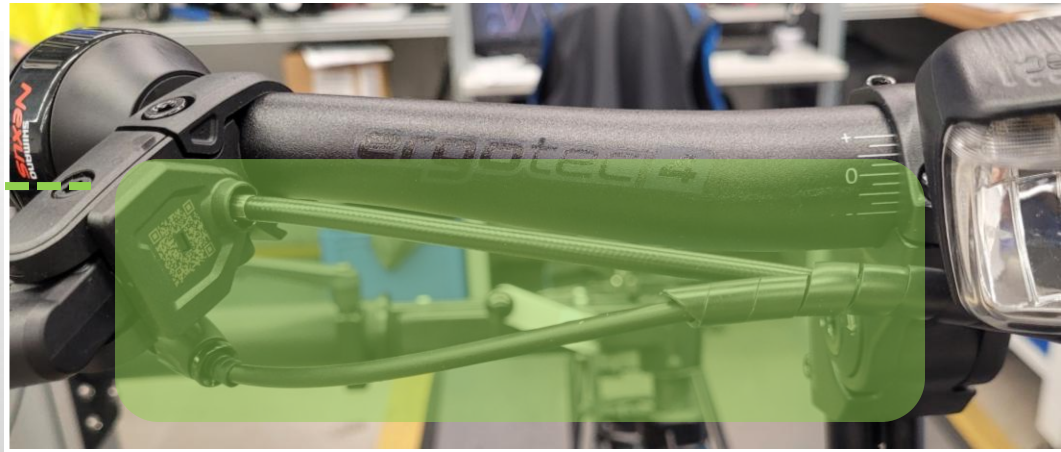
Make sure the shift cables are properly secured at their mounting points.

Shift cable

Shimano: 1700mm

Enviolo: 1800mm



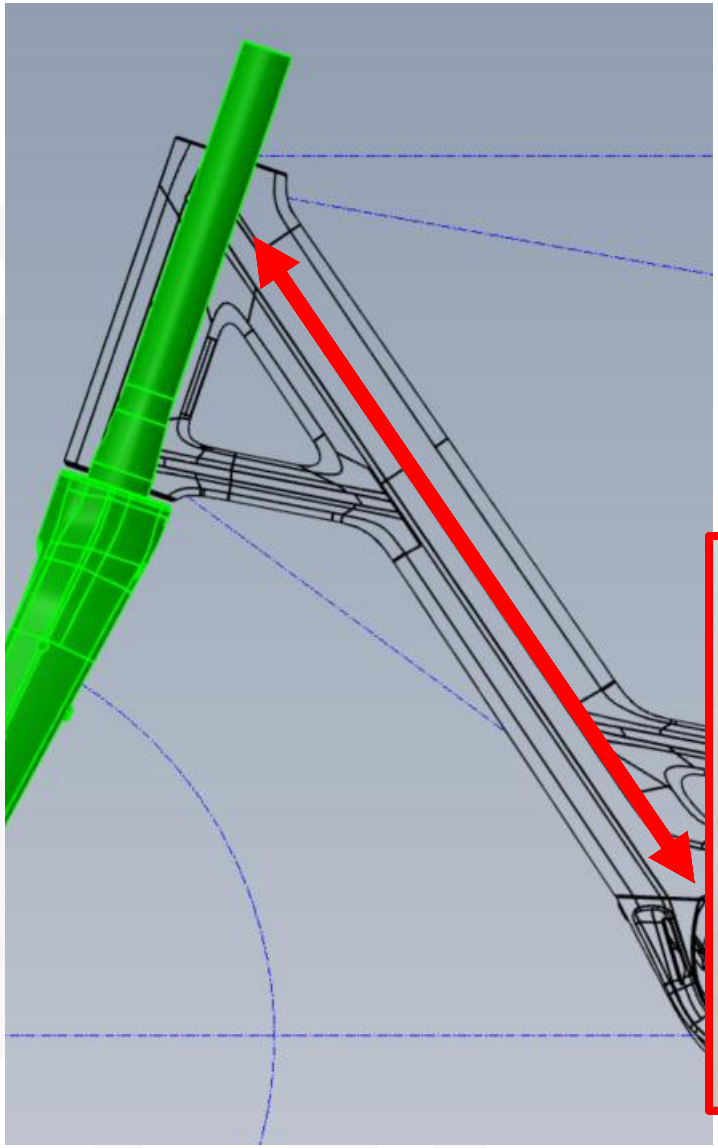


Make sure the shift cables run in the same neat curve as the brake lines.

Trim any excess shift cable, or if there is up to 50 mm of excess, route it back into the frame.

Assembly of the Noise Protectors

After the cable routing, both ends of the brush must be folded over as shown and positioned in a way that they cannot touch the steerer tube or the drive unit.



<u>Drive Unit CX and PX Mounting Accessories</u>:

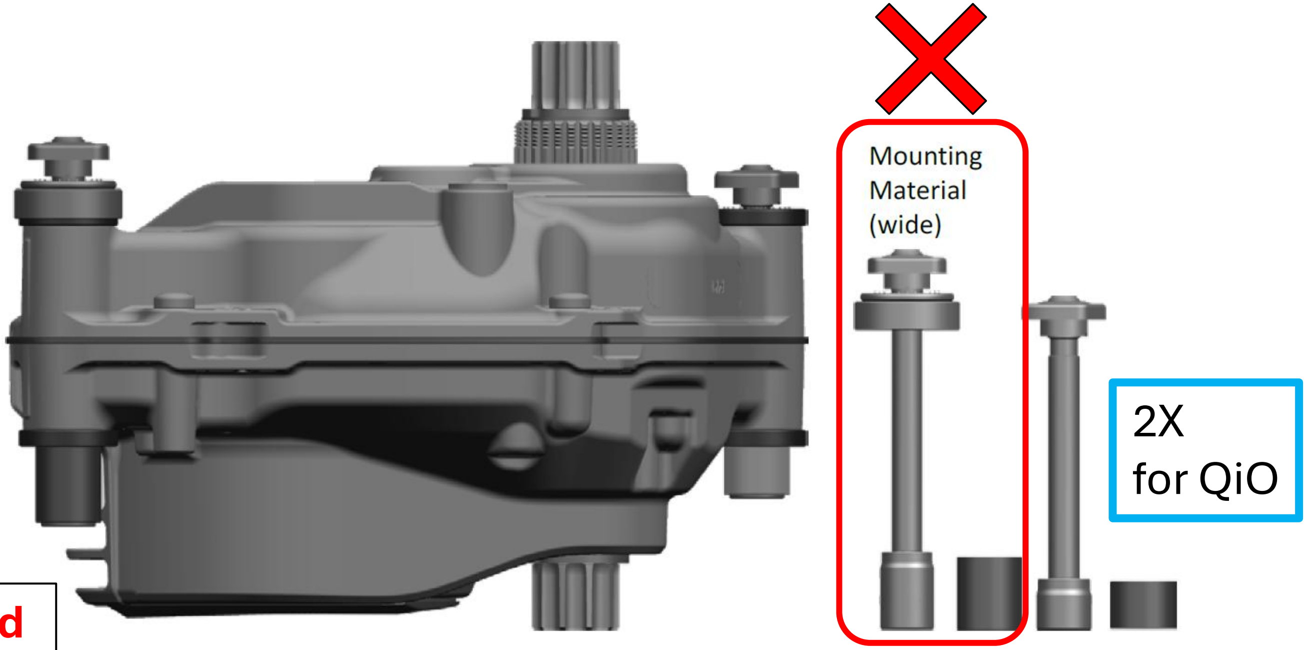
Bolts - short / long

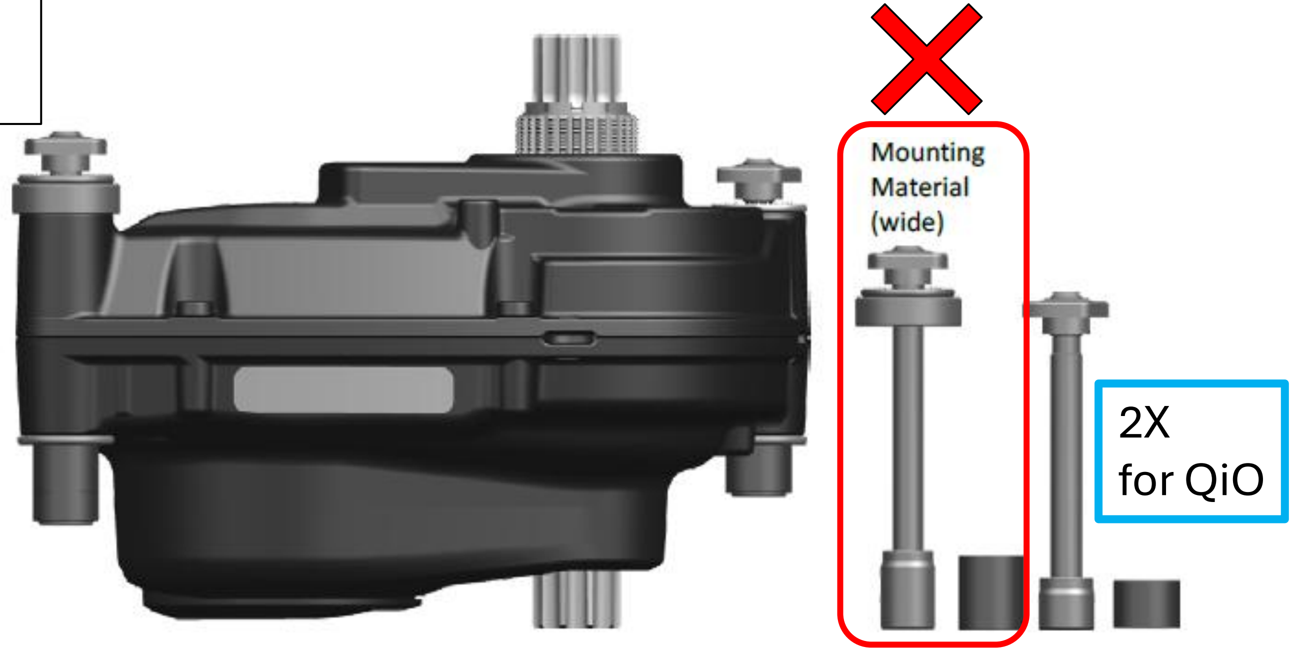
Insert Socket - short / long

Adapter Interface

Motor Nut

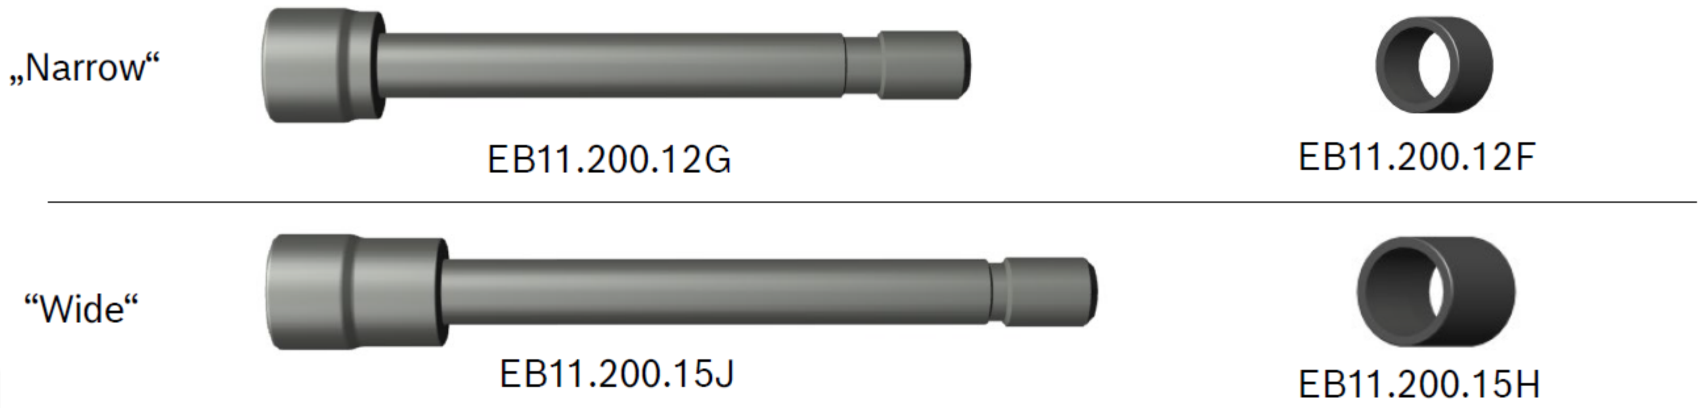
Only the short bolts and insert sockets are used for QiO Production.



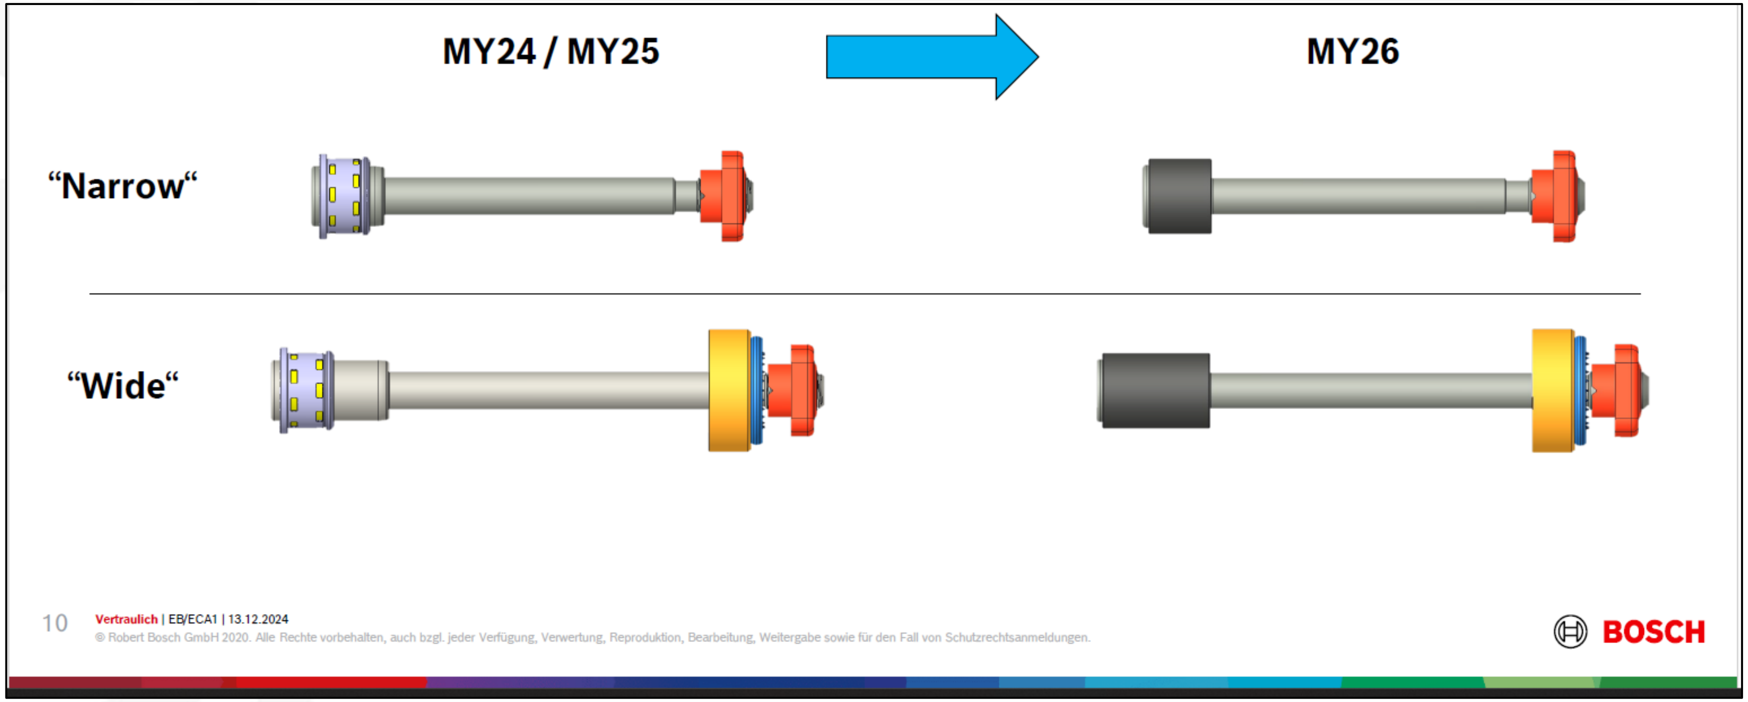


New bolts and insert socket:

All bolts and inserts are being converted to the new version during the ongoing process.



NEW Screw M8x1x68,7	-	EB11.200.12G
NEW Insert Socket short	-	EB11.200.12F
Adapter for Wide Interface BDU31YY, BDU34YY, BDU38YY	-	EB11.200.0T9
NEW Screw for Wide Interface BDU31YY, BDU34YY, BDU38YY	-	EB11.200.15J
NEW Insert Socket long	-	EB11.200.15H

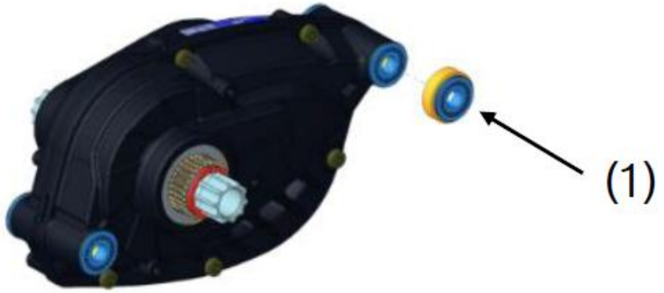


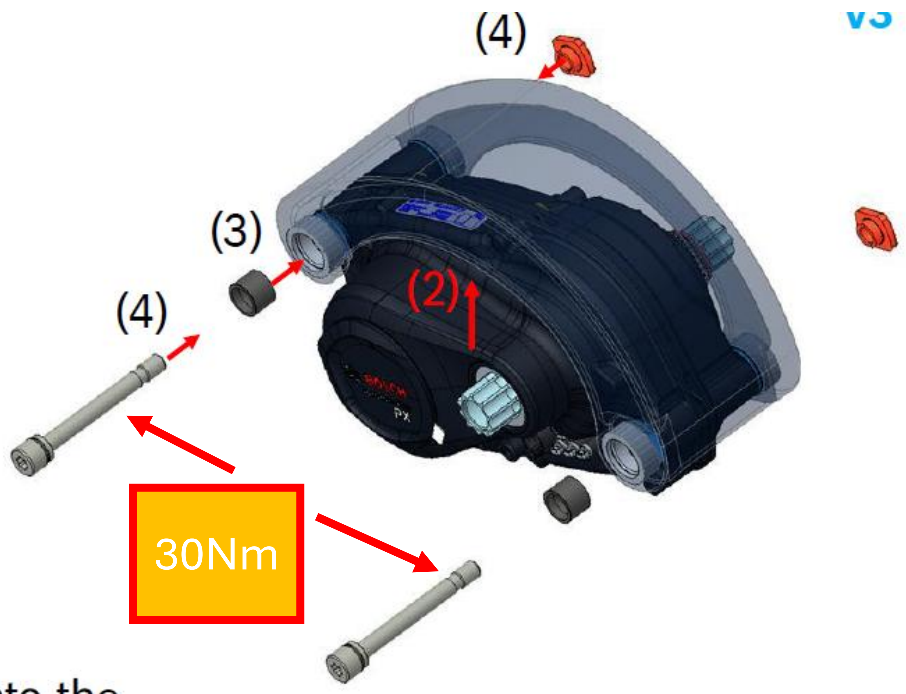
Drive Unit Cable Routing Options:

Care should be taken to ensure that the cables are not crushed when inserting the motor.

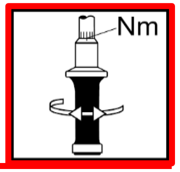
BDU34YY Assembly Instruction

UFI Mounting 2.0 Assembly (i)

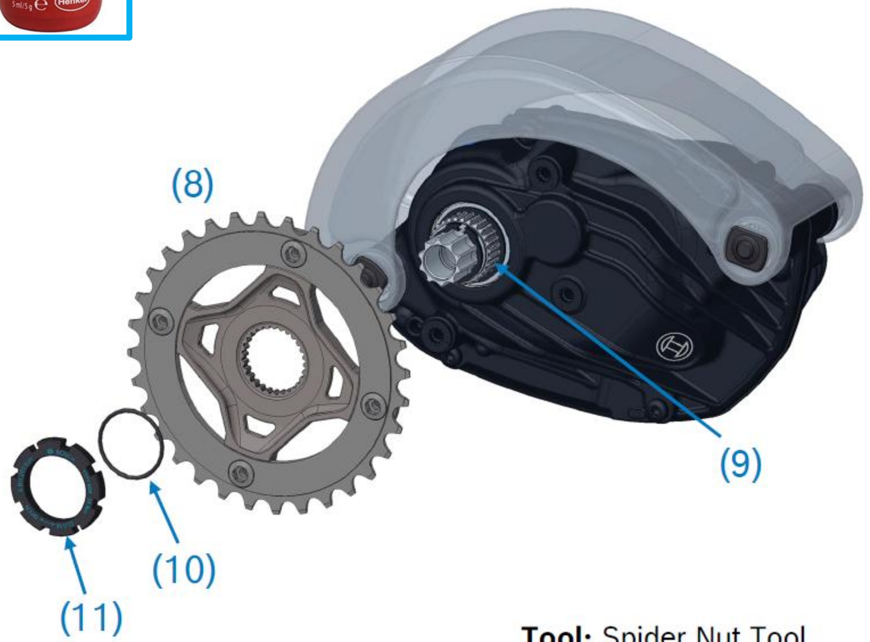




- Only “wide” version: push adapter onto DU by hand (1)
- Put drive unit into the frame interface (2)
- Push the insert sockets (no specific direction) by hand into the frame all the way, make sure they touch the drive unit (3)
- Insert the screws and lightly tighten them in the opposite nuts (4)
- Tighten screws with 30Nm (tool accuracy <5%); use Torx T40.



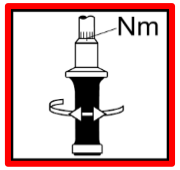
Mounting chainring and chain guard.



Torque: according to manufacturer's specifications / max. tightening torque: 10 Nm

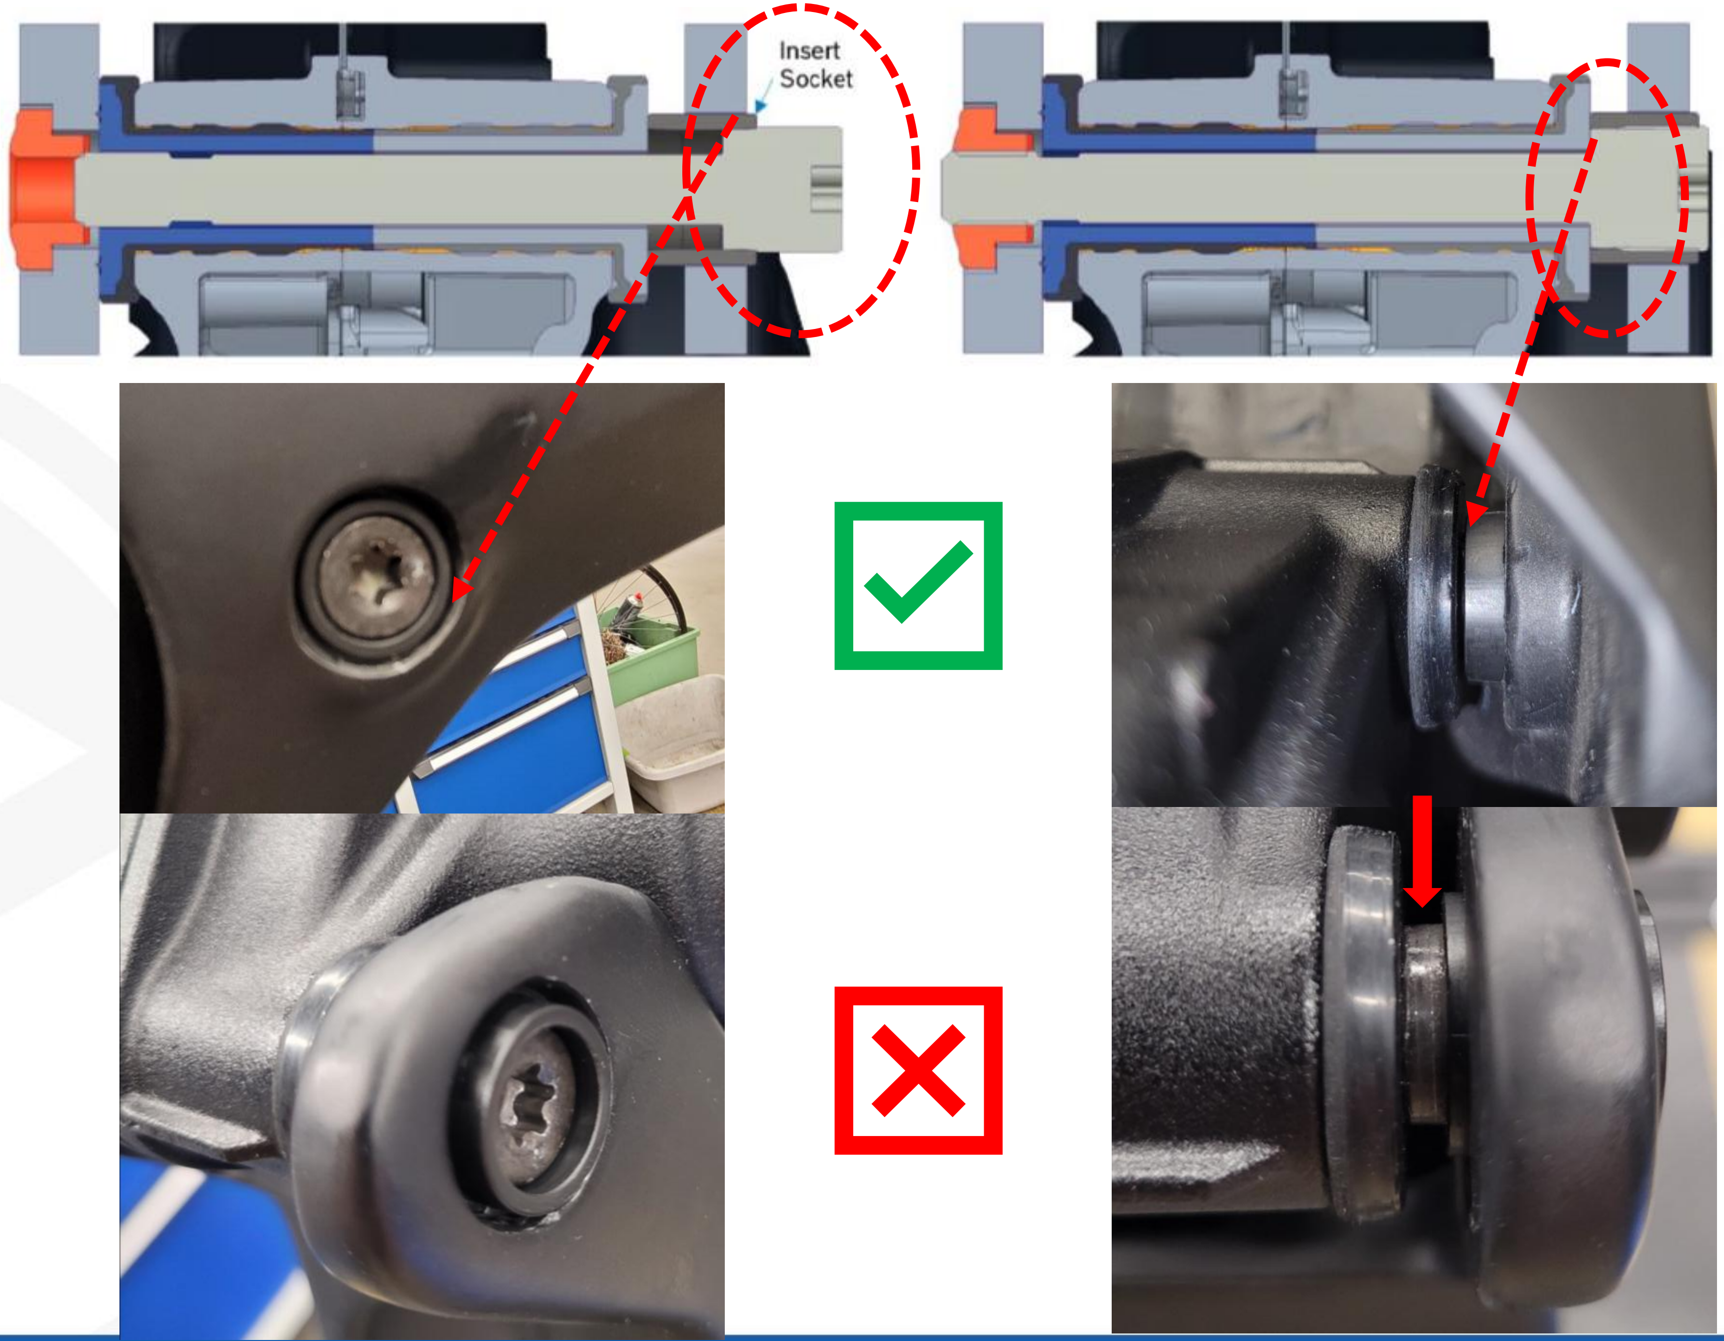
Tool: Spider Nut Tool

Torque: 35 Nm



Correct fit of the insert sockets:

When placing the insert sockets, it is important to ensure that the final placement deviates by no more than 1 mm to 1.5 mm.



Slot assignment:

Unused slots must be filled with blanking plugs.

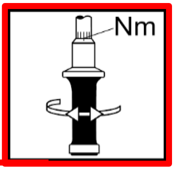
BDU 347Y

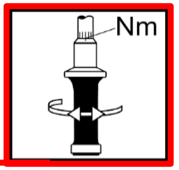
CX

BDU 384Y

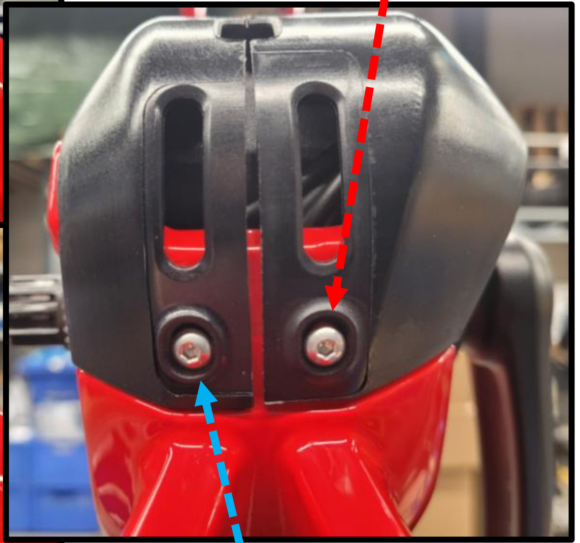
3-4 Nm



3-4 Nm



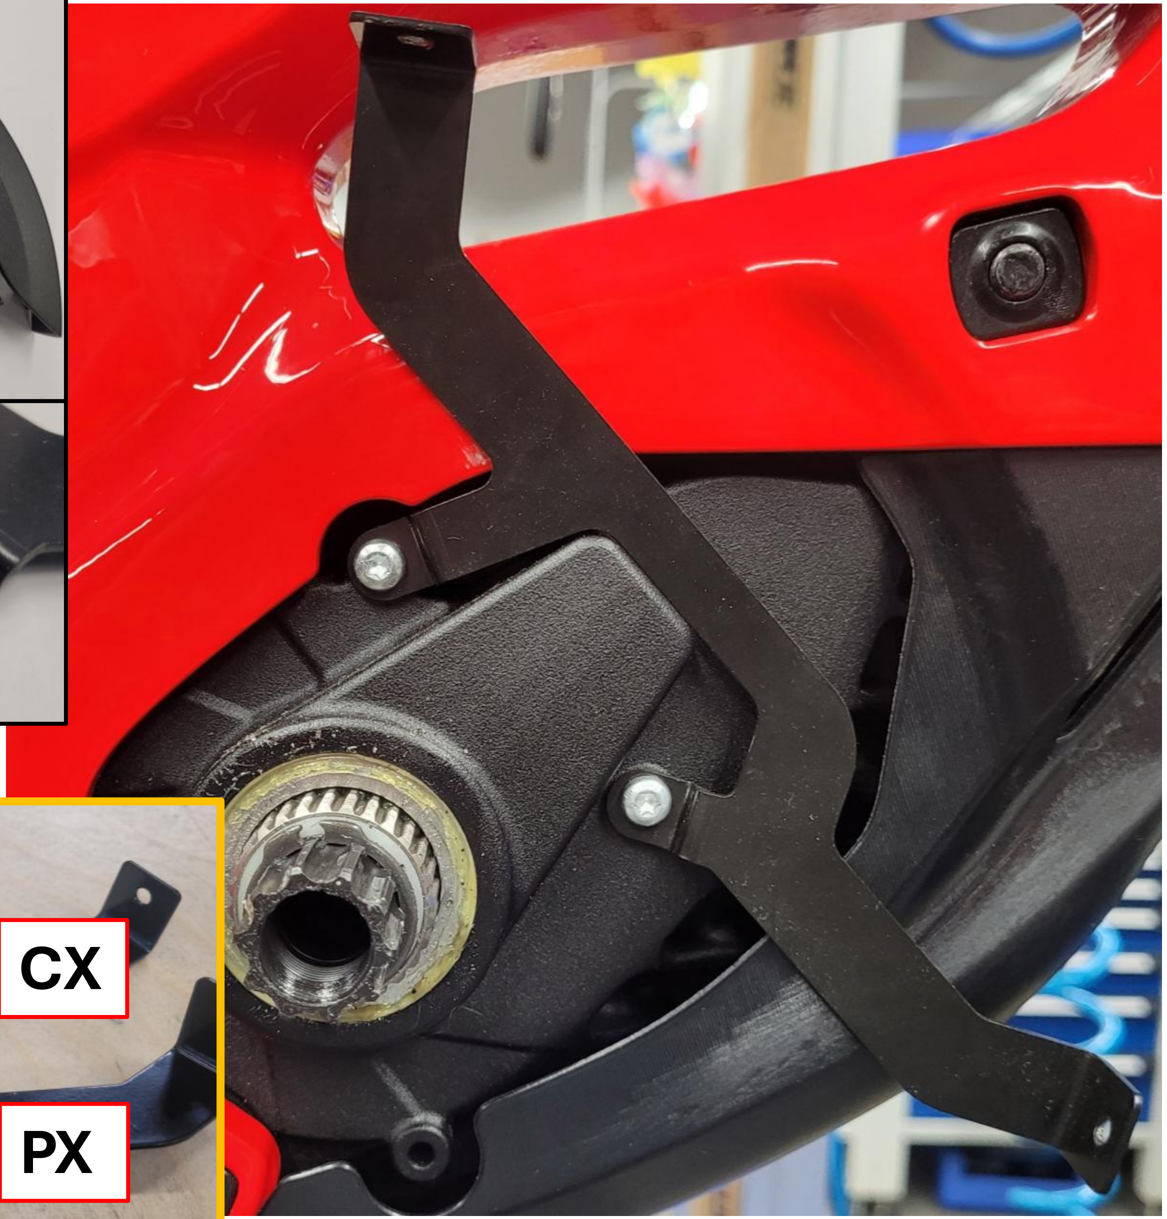
4x M4 countersunk screw

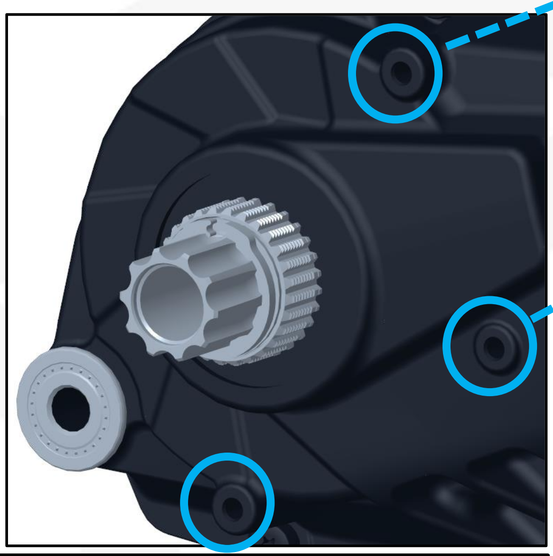


Installing the belt guard:

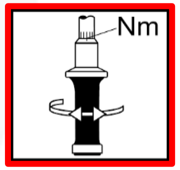
Place the belt guard in the correct position and use the correct screws.

There are also different belt guard holders for the different CX/PX engines.





First mount 3,5 – 4,5 Nm

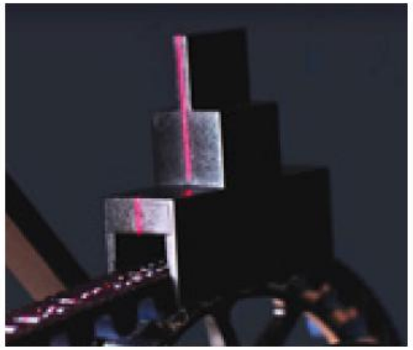


Align the belt guard so that it does not rub when pedaling.

Gates®

BELT DRIVE

Required tools for professional disassembly and assembly of the Gates Drive system.



GATES UT Laser Alignment Tool

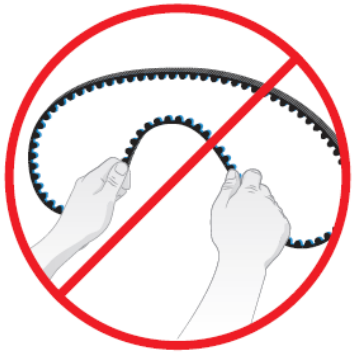
GATES Pulley Wrench

Spider Tools from the respective manufacturers

DANGER

Use Caution.
Although clean of grease, belt drives can still catch pants, skirts or loose clothing. Installation of a belt guard is recommended.

DO NOT TWIST



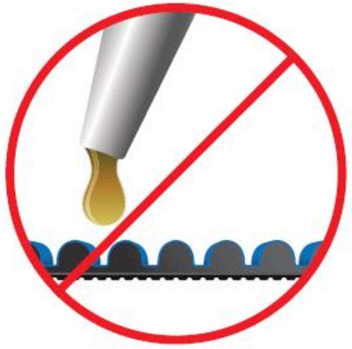
DO NOT BACKBEND BY HAND

DO NOT CRIMP

DO NOT INVERT

DO NOT ZIP TIE

DO NOT USE BELT AS A SPROCKET REMOVAL TOOL



DO NOT LUBRICATE

DO NOT PRY ON

DO NOT ROLL ON

To remove the sprockets, use the correct spider tool.

SHIMANO

9-SPLINE

ROHLOFF

ENVIOLO

Securement: Snapring

Securement: Lockring

Please note the different mounting configurations of the pulleys.
In addition, be sure to follow the fastening instructions provided by the respective manufacturers and adhere to their specifications (torque).

Installation and Removal Example - Rohloff

Position the pulley. Label side facing up.

Position the pulley correctly—pay attention to the teeth. Screw on the lock ring.

Tighten the lock ring to the correct torque (40 Nm).

Installation and Removal Example - Rohloff

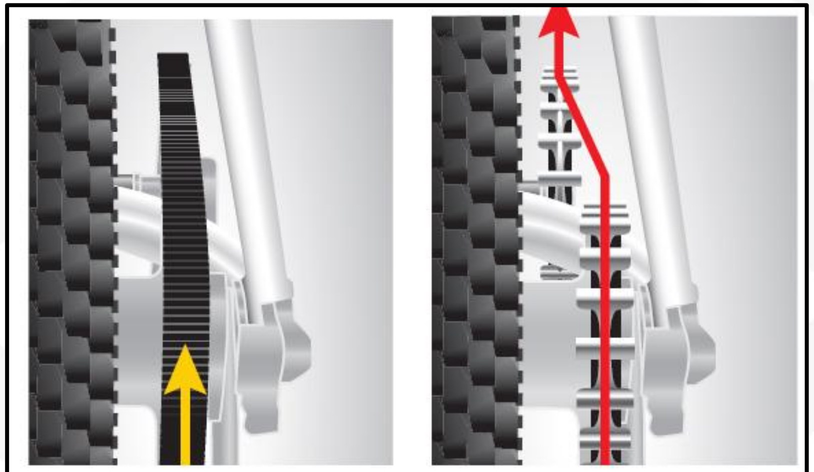
Use the sprocket wrench to secure the pulley as shown in the picture.

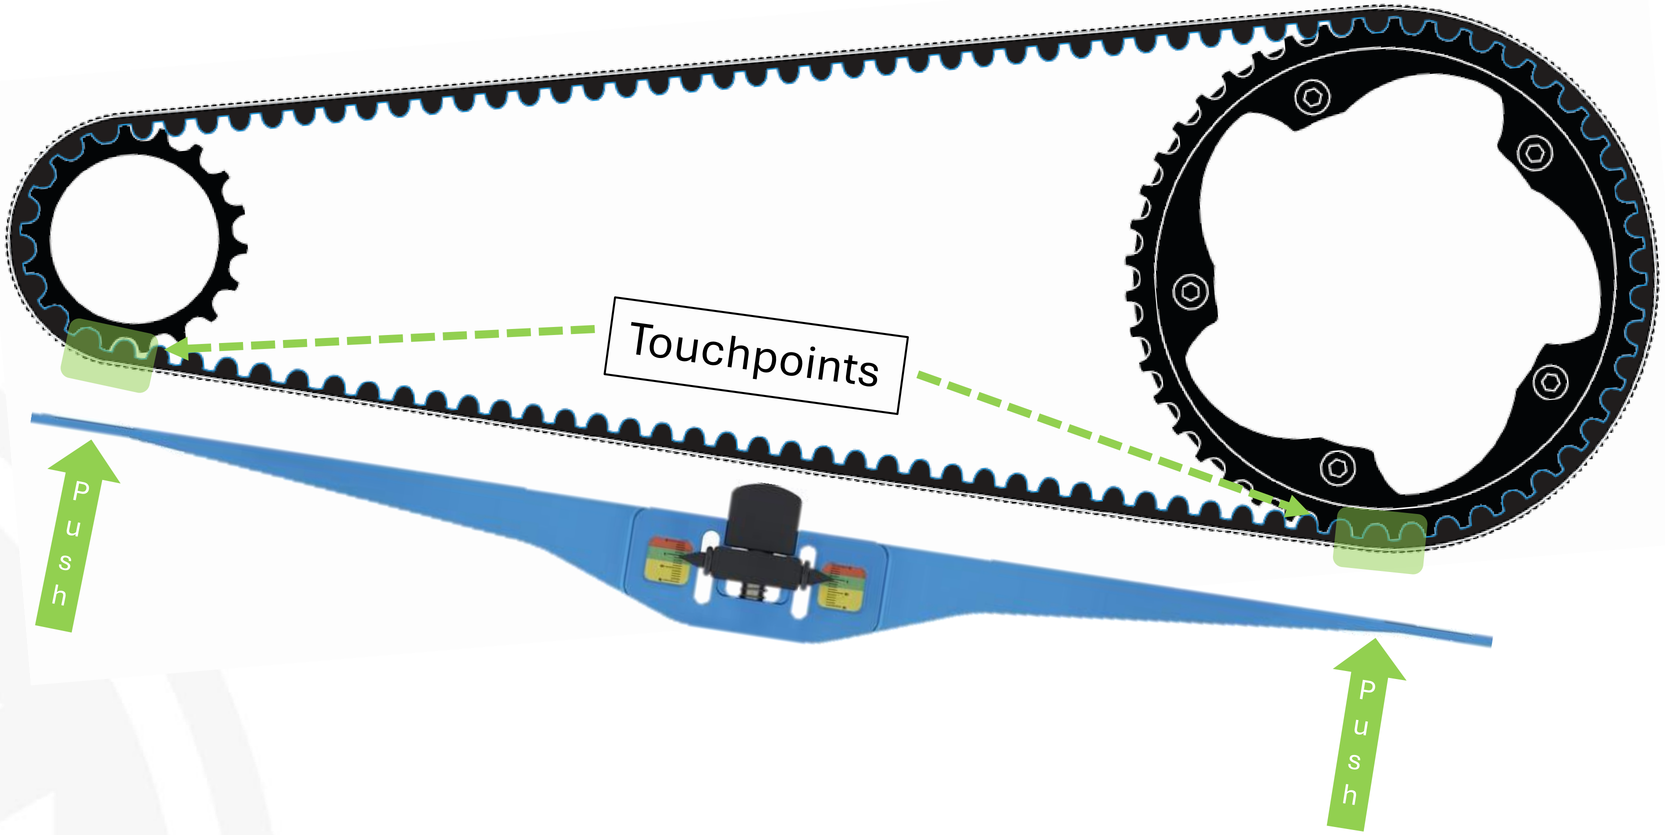
Loosen the lock ring using the appropriate attachment, as shown in the picture.

Now you can unscrew the lockring all the way and remove the pulley.

PROPER ALIGNMENT

Alignment is critical, and depending on the particular bike and setup, spacers may be used to ensure proper alignment. Sprockets that are out of alignment can cause noise, wear, or belt walk-off. Belt alignment refers to the parallel (side to side) and angular (toe in – toe out) alignment of the belt between the front and rear sprocket positions. Proper alignment is critical in order to maintain proper system performance.

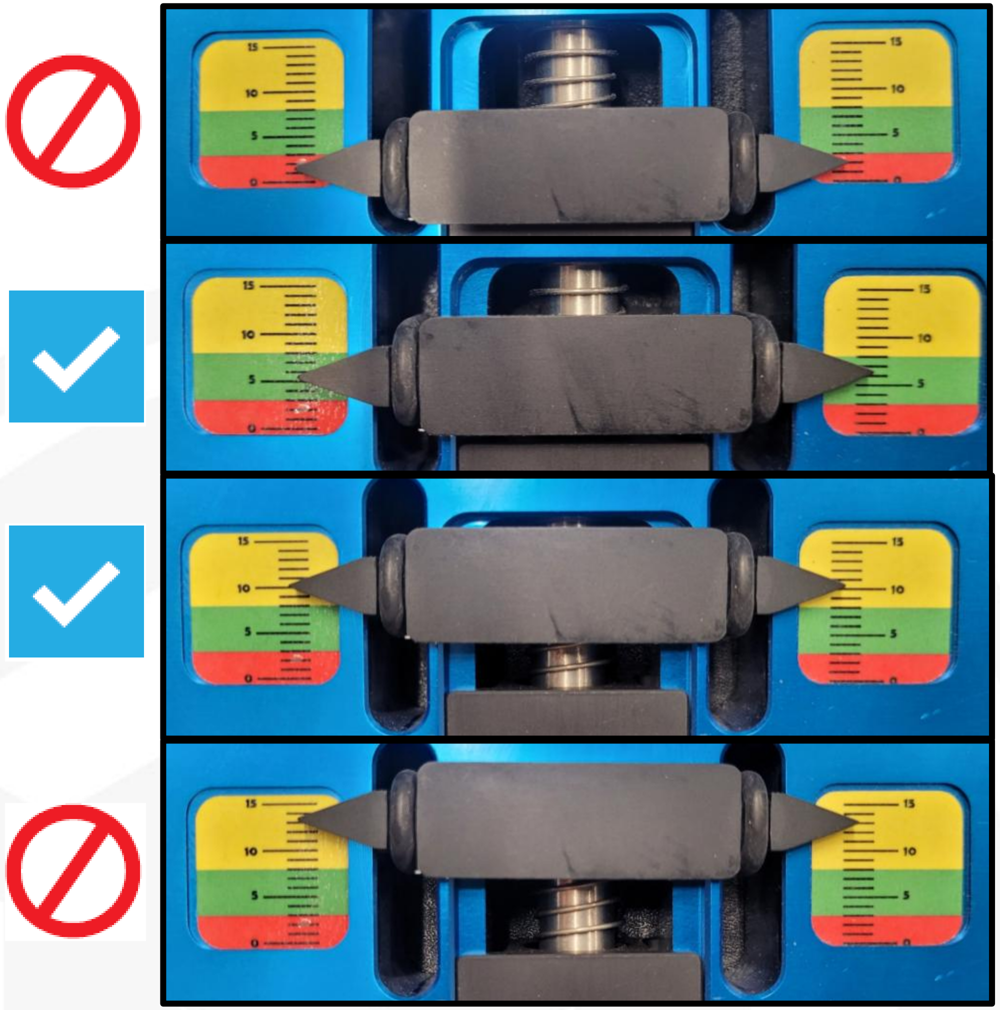




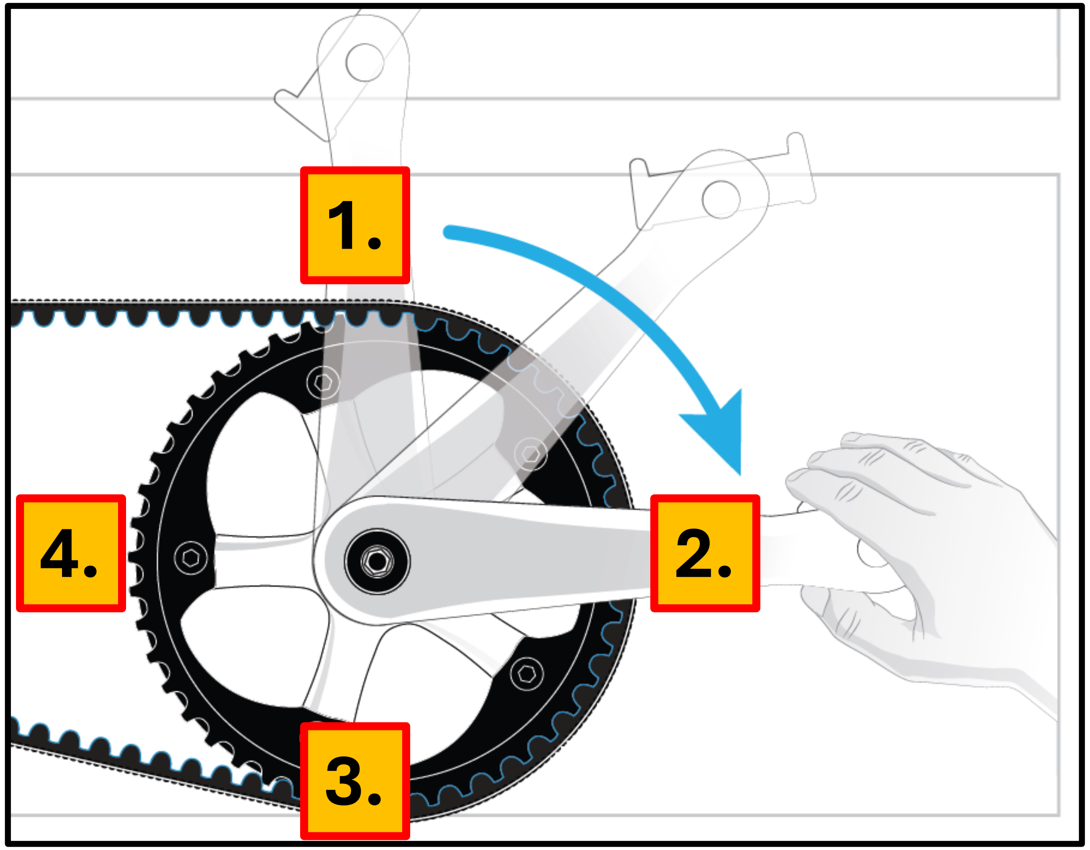
Before measuring the belt tension, make sure the rear wheel is securely bolted to the frame at the appropriate mounting points.

Make sure the belt is properly aligned, and then begin to tighten the belt.

Once the belt tension is correct, check again to make sure the belt is properly aligned.



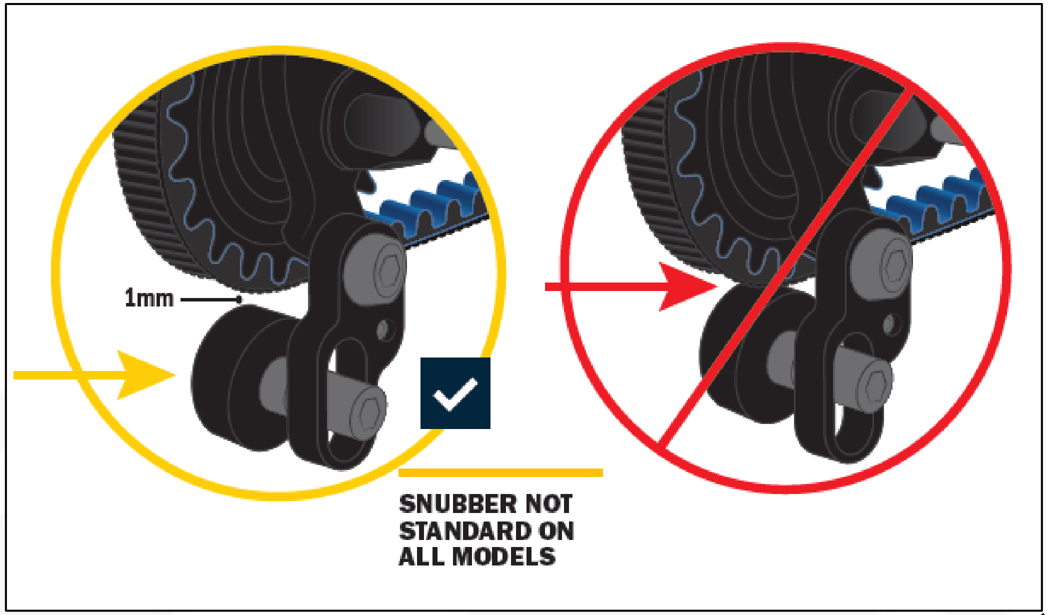
The belt tension is measured four times as shown in the picture.



3 times		1 time		= fail
3 times		1 time		= fail
3 times		1 time		= pass
3 times		1 time		= pass

Pay special attention to the yellow area during the initial installation.

Yellow up to mark 10 is OK.
Yellow beyond mark 10 is a failure.

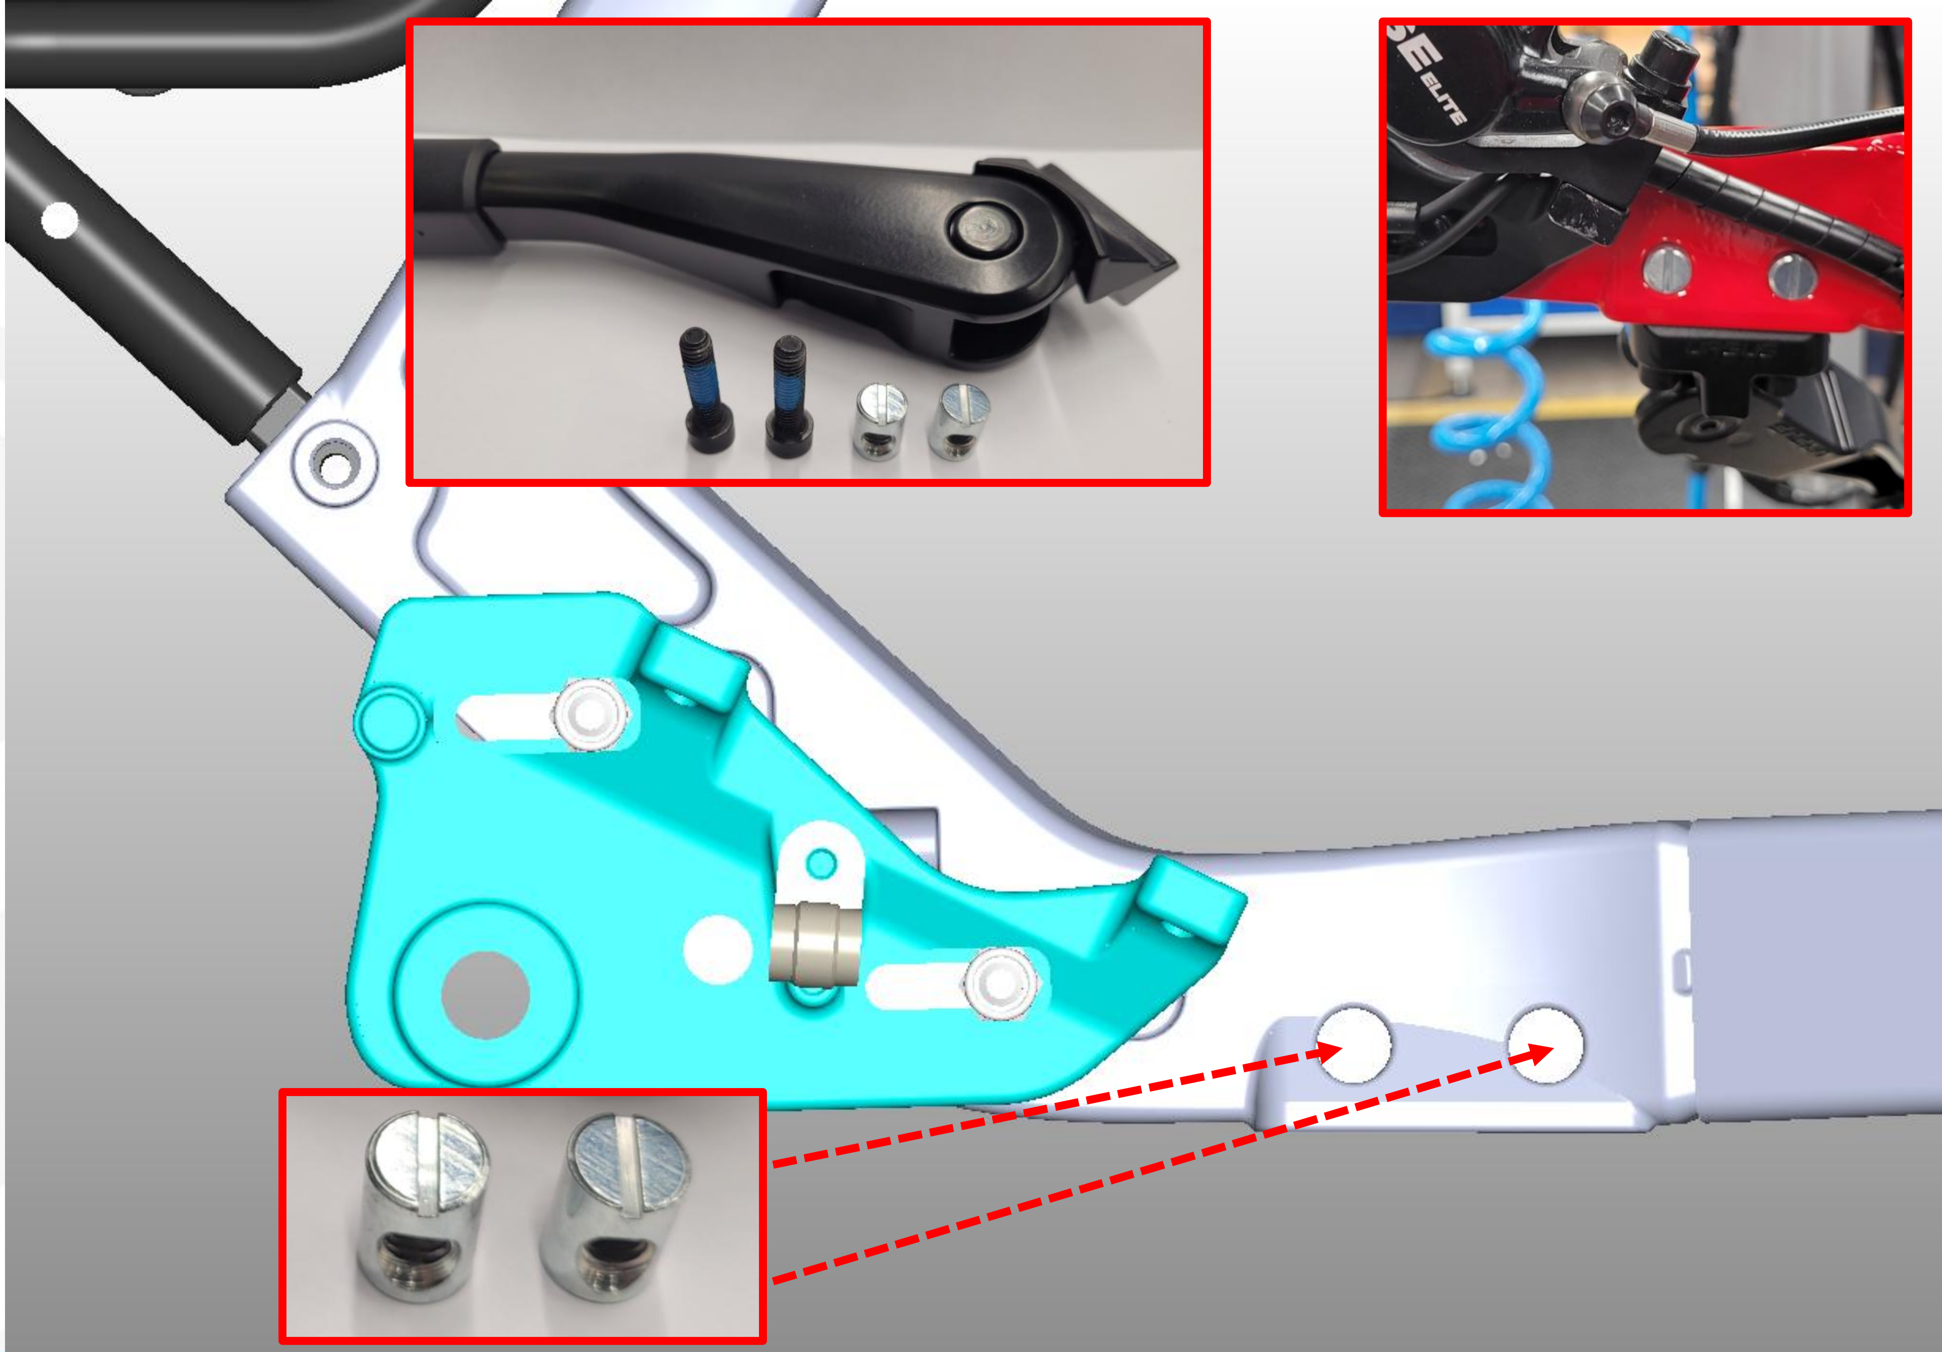


If a snubber is installed, follow the manufacturer's specific installation instructions.

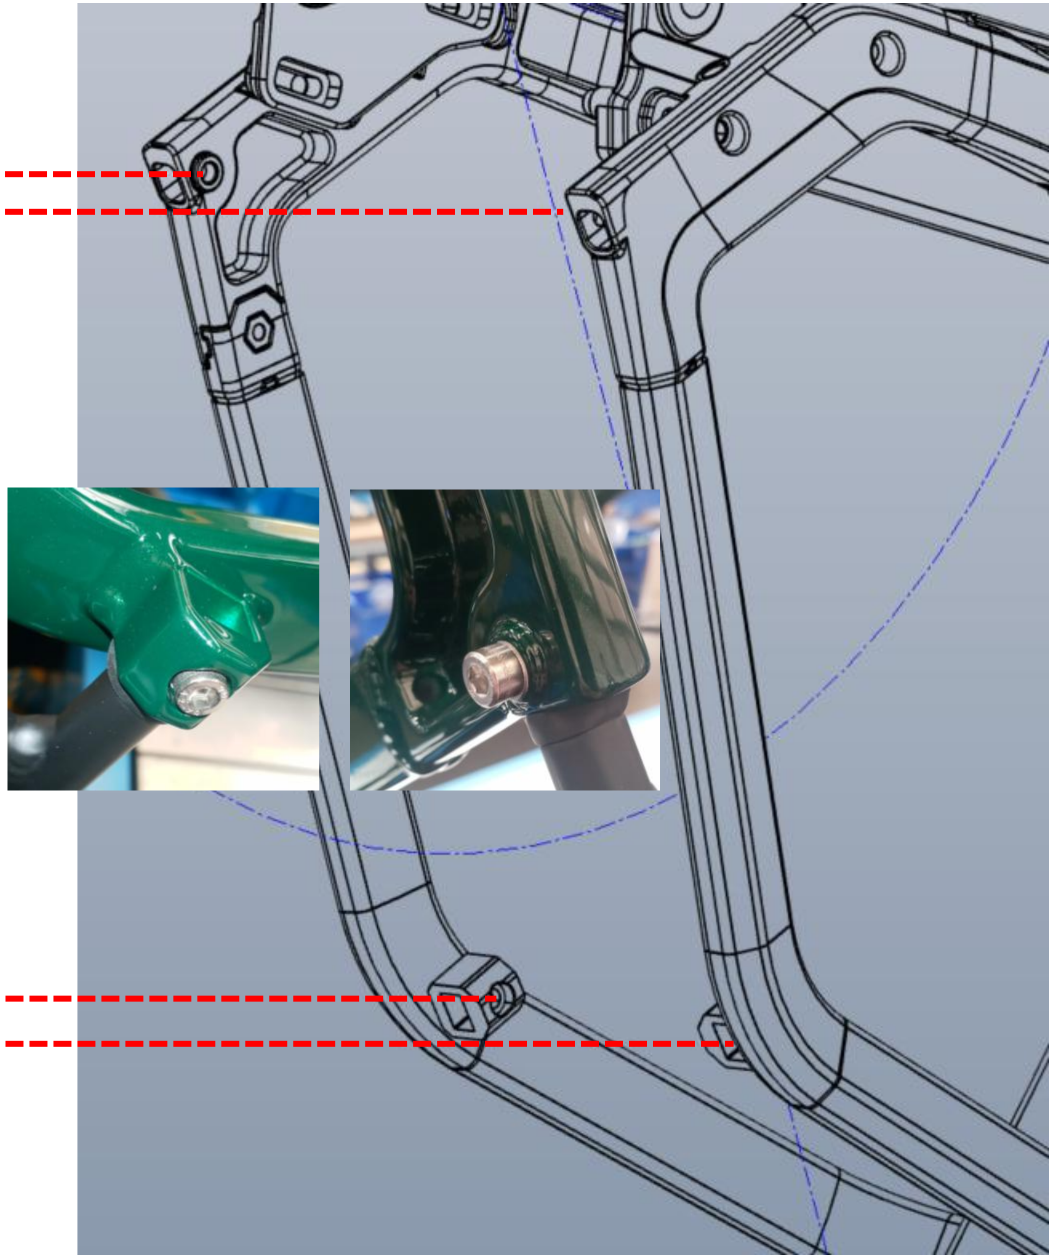
However, the distance between the pulley and the belt remains the same, as shown in the picture.

Stand assembly

In order to insert the threaded sleeves into the frame, the recess must be free of paint.



M5X14mm



M5X12mm

Frame lock

The screw and nut must be REPLACED.

Do not use the old ones!

When opening the frame, avoid chipping the paint. Cut into the paint with a utility knife.

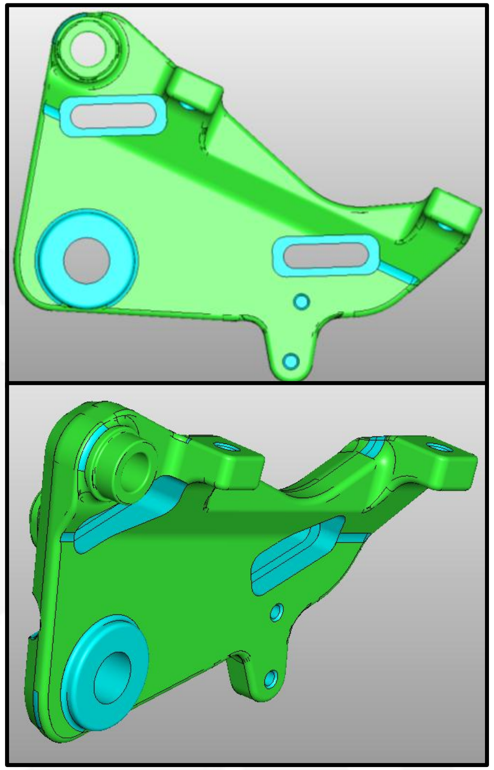
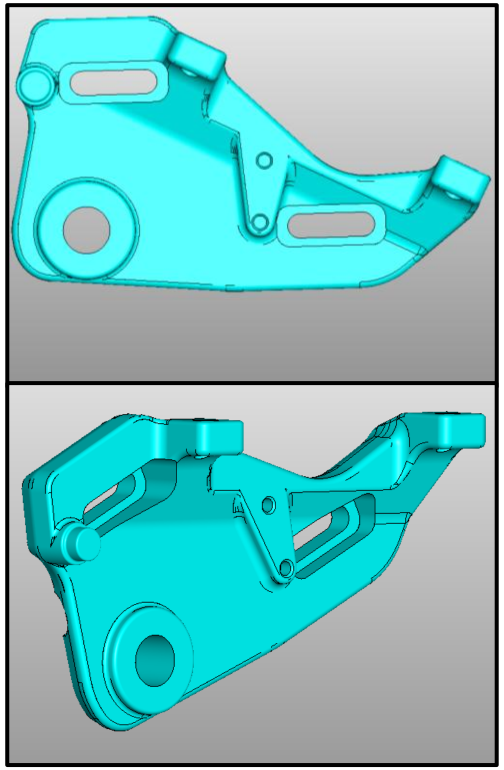
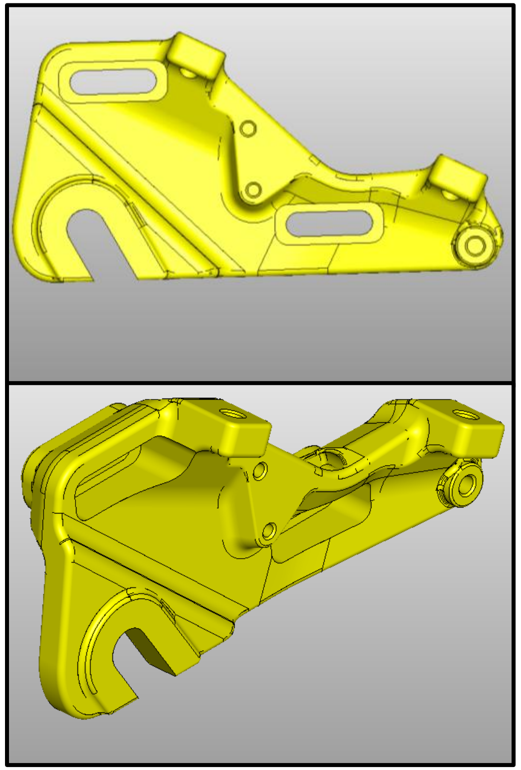
3X3 Slider



Enviolo Slider

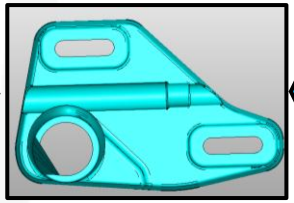


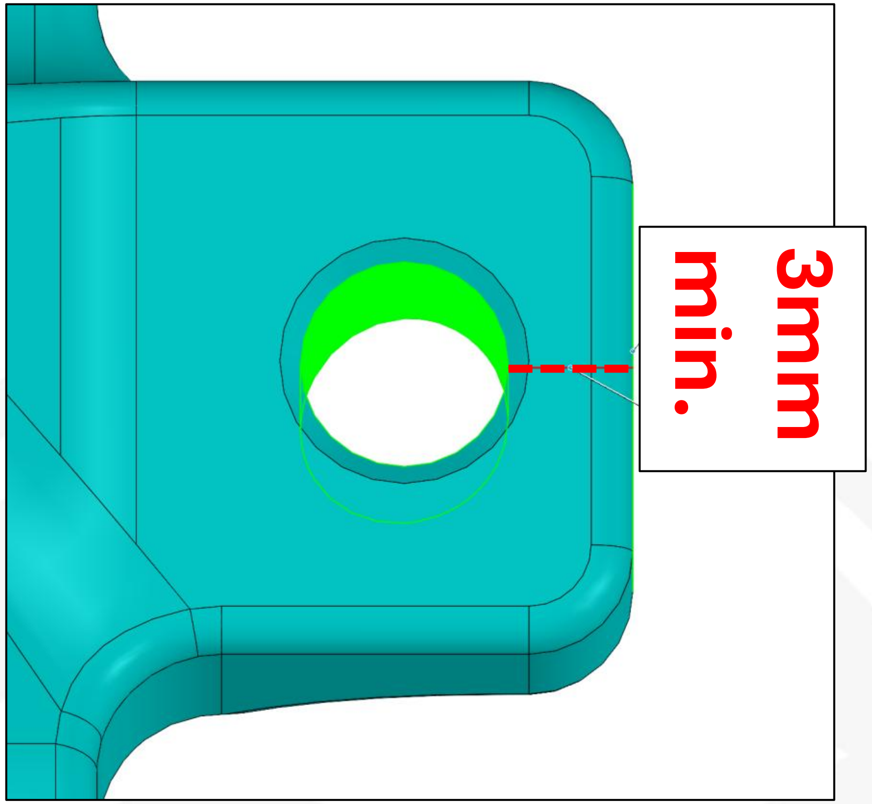
Standard Slider

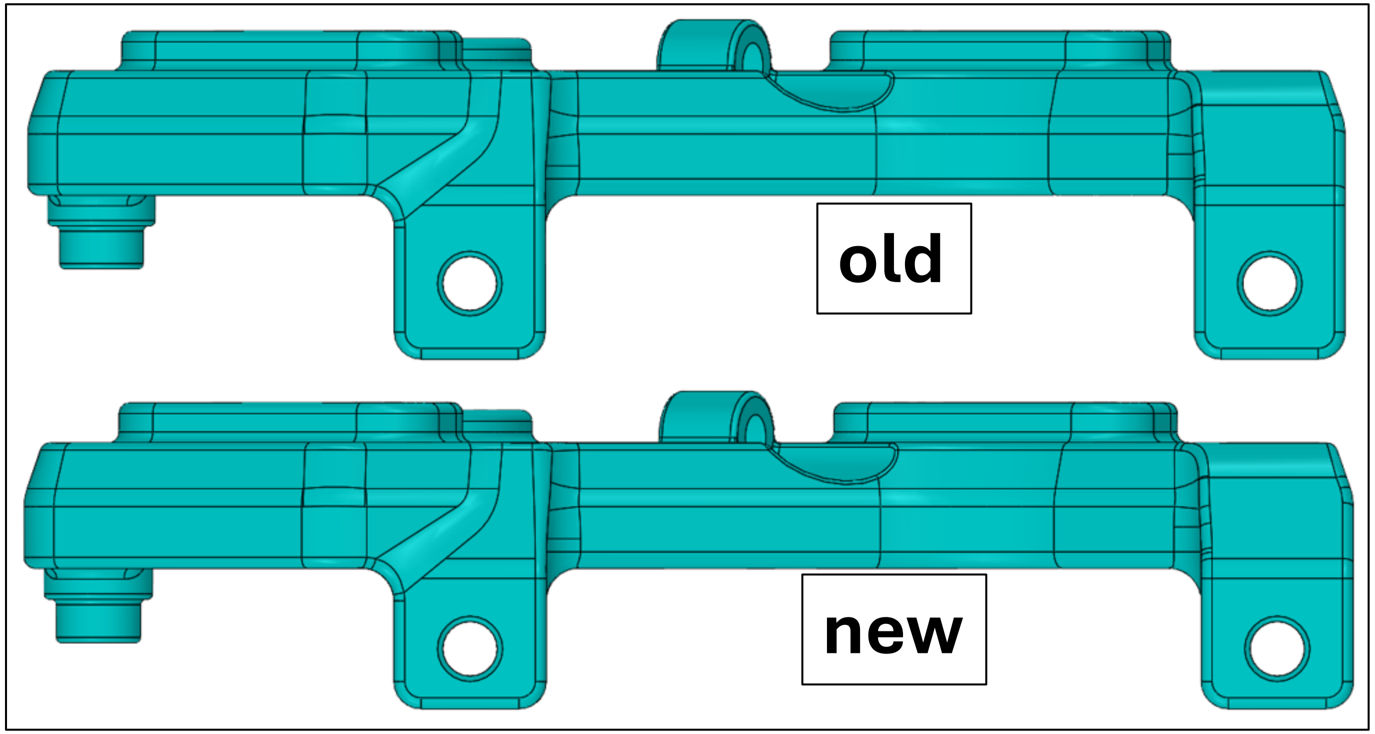


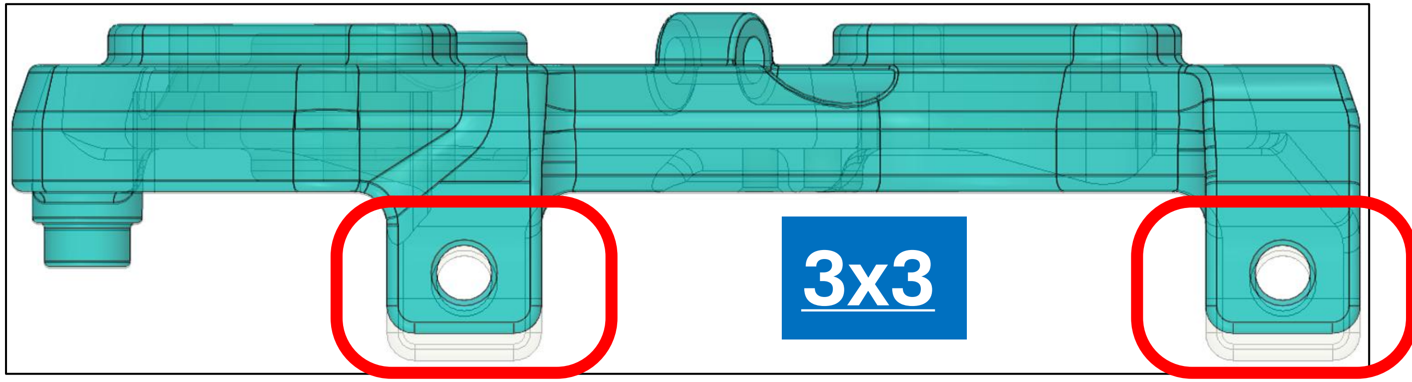
Slider Installation

It is important to use the correct sliders for the different rear wheel hubs.









Slider Installation 3x3

The first 200 sliders for the 3x3 hub have very limited installation space. This requires slight reworking of the sliders in the brake mount area.

Grind the area down to a thickness of 3 mm. The thickness must not be less than 3 mm.
Paint the sanded area black.

3x3

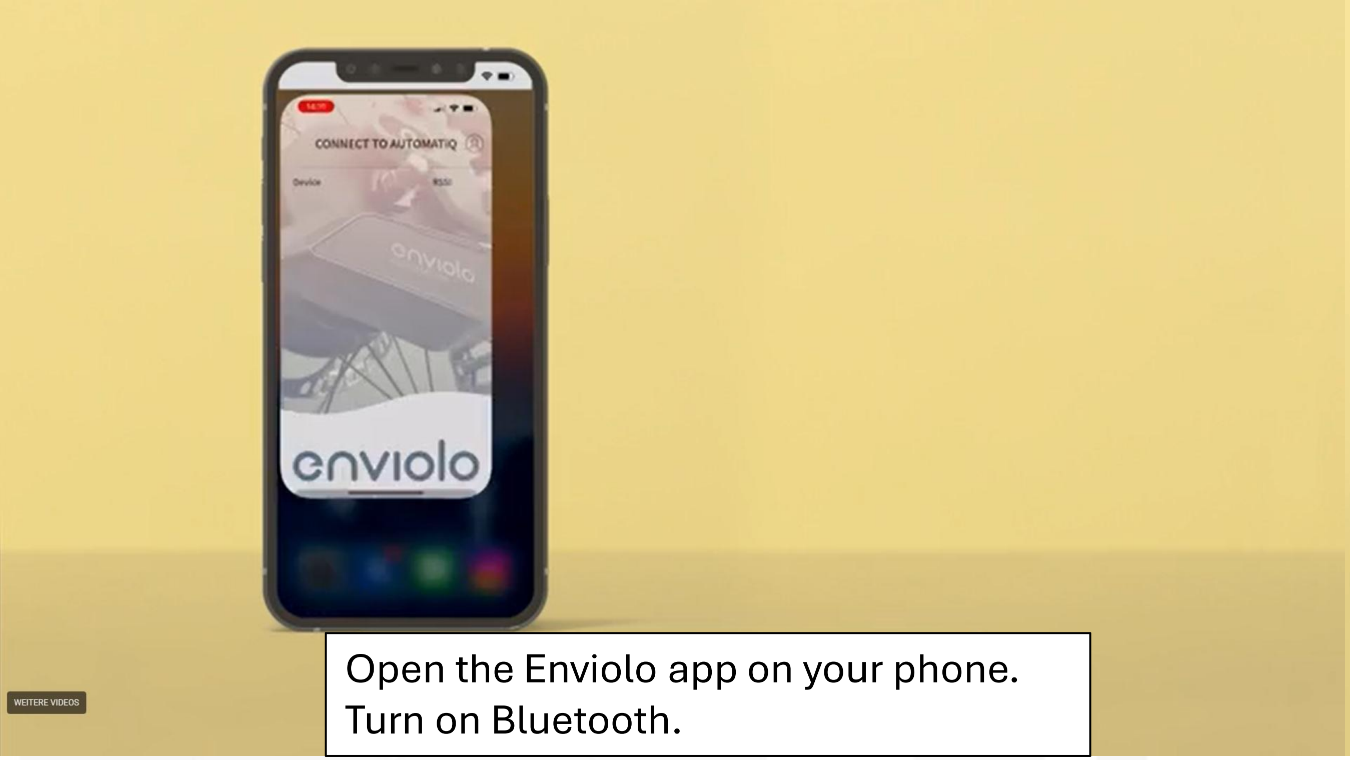
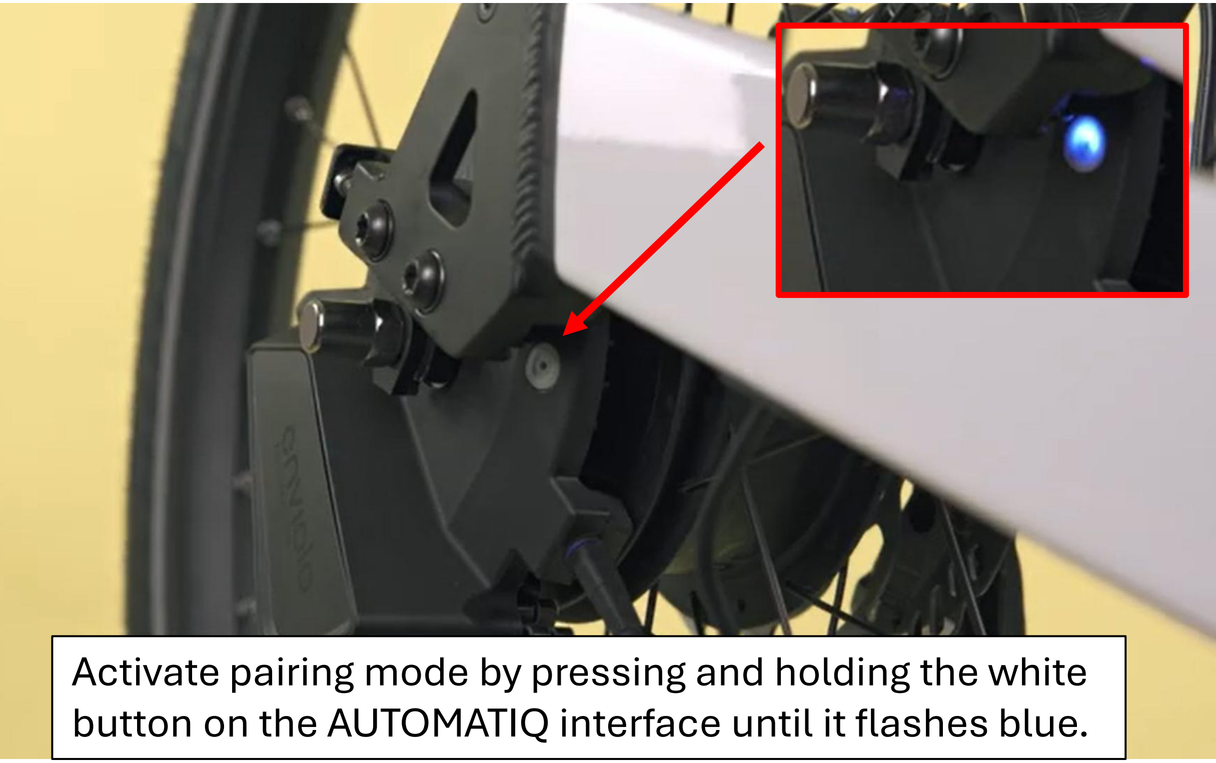
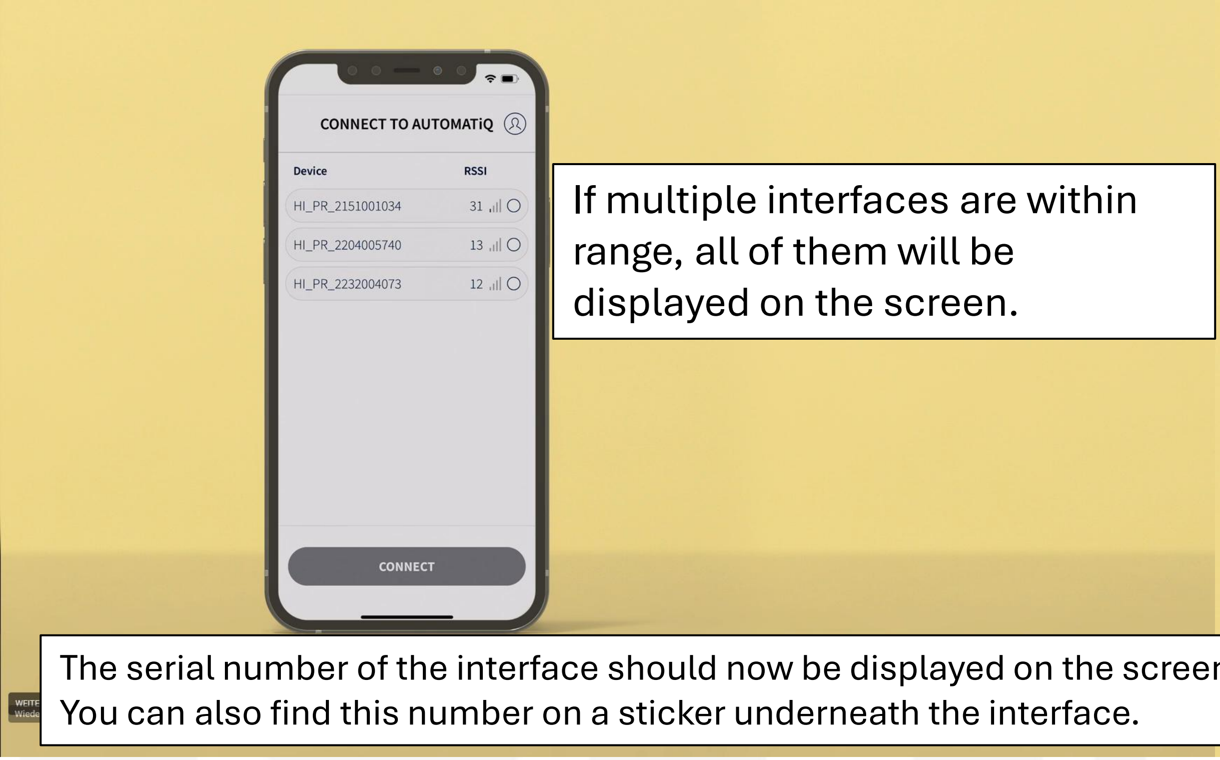
Chainstay area
Range of tolerance



Open the Enviolo app on your phone.
Turn on Bluetooth.

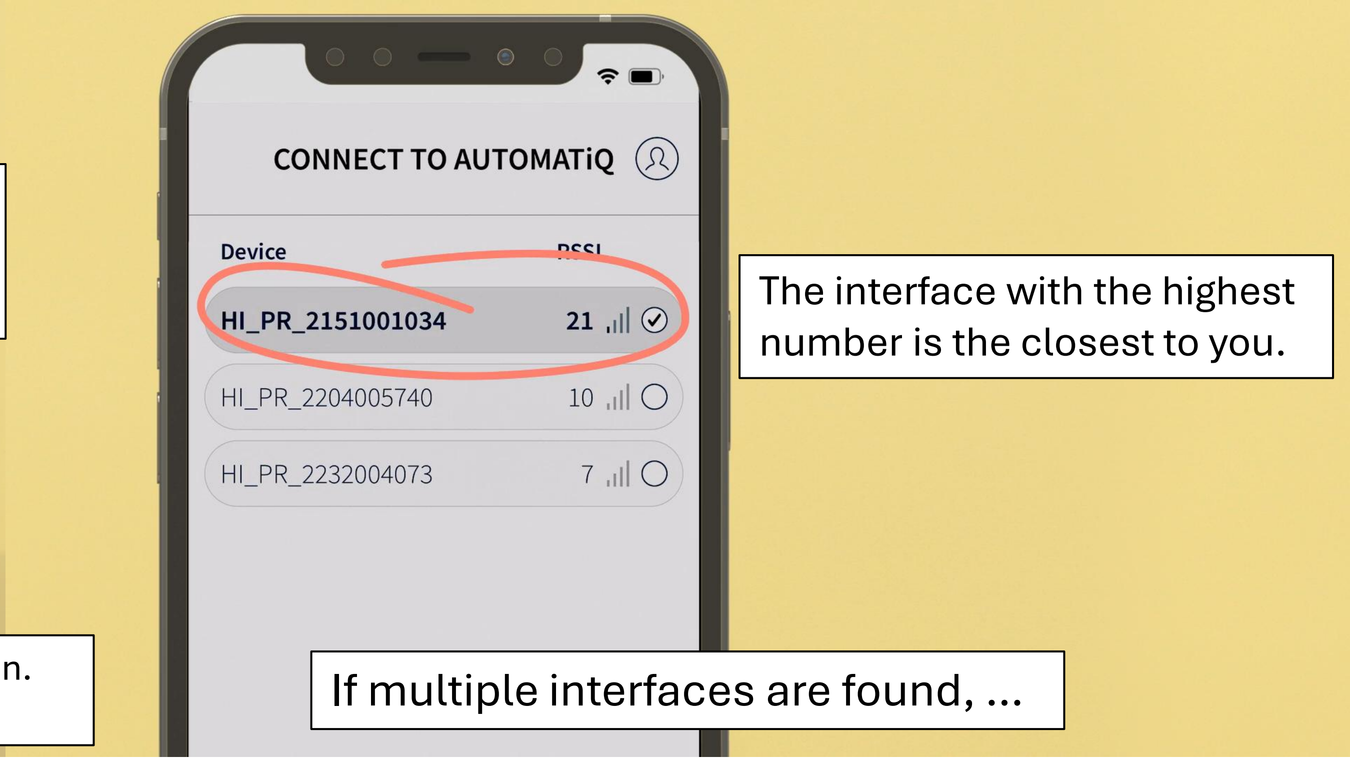


Activate pairing mode by pressing and holding the white button on the AUTOMATIQ interface until it flashes blue.



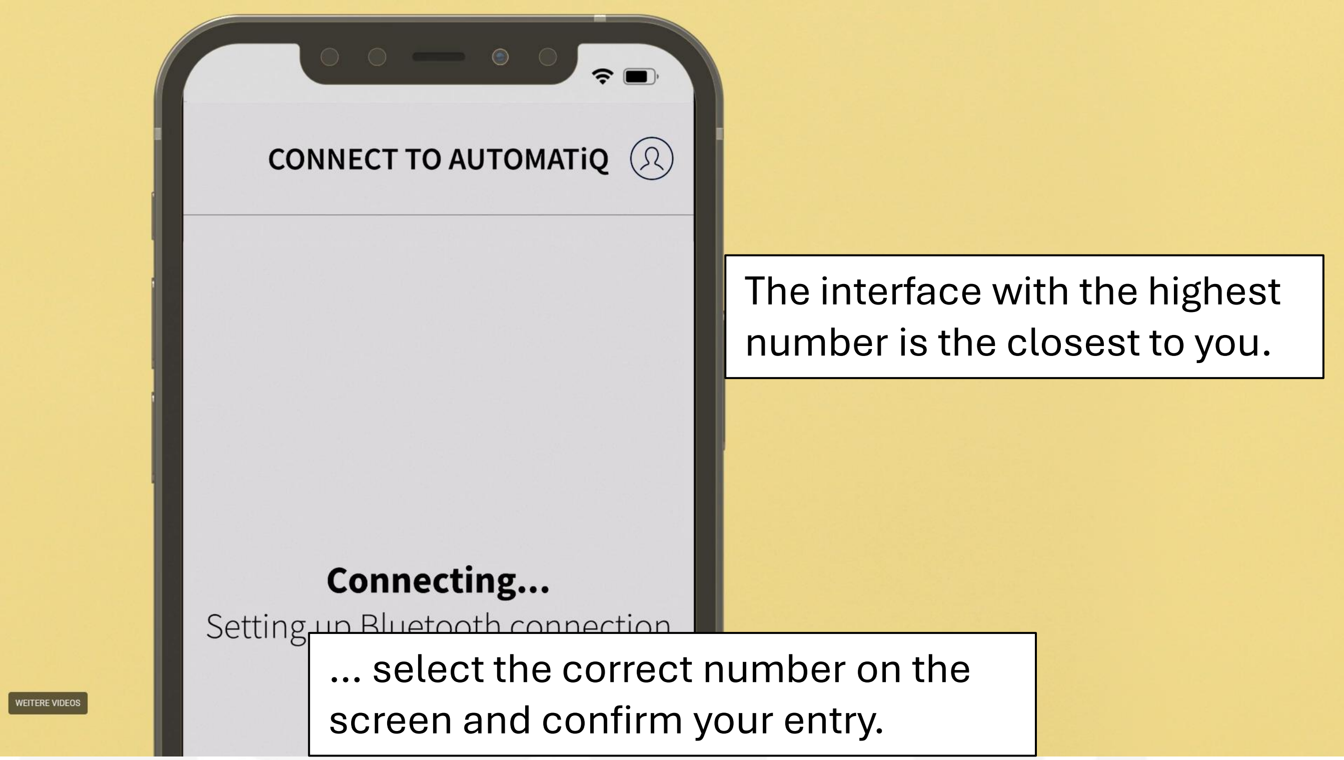
The serial number of the interface should now be displayed on the screen. You can also find this number on a sticker underneath the interface.

If multiple interfaces are within range, all of them will be displayed on the screen.



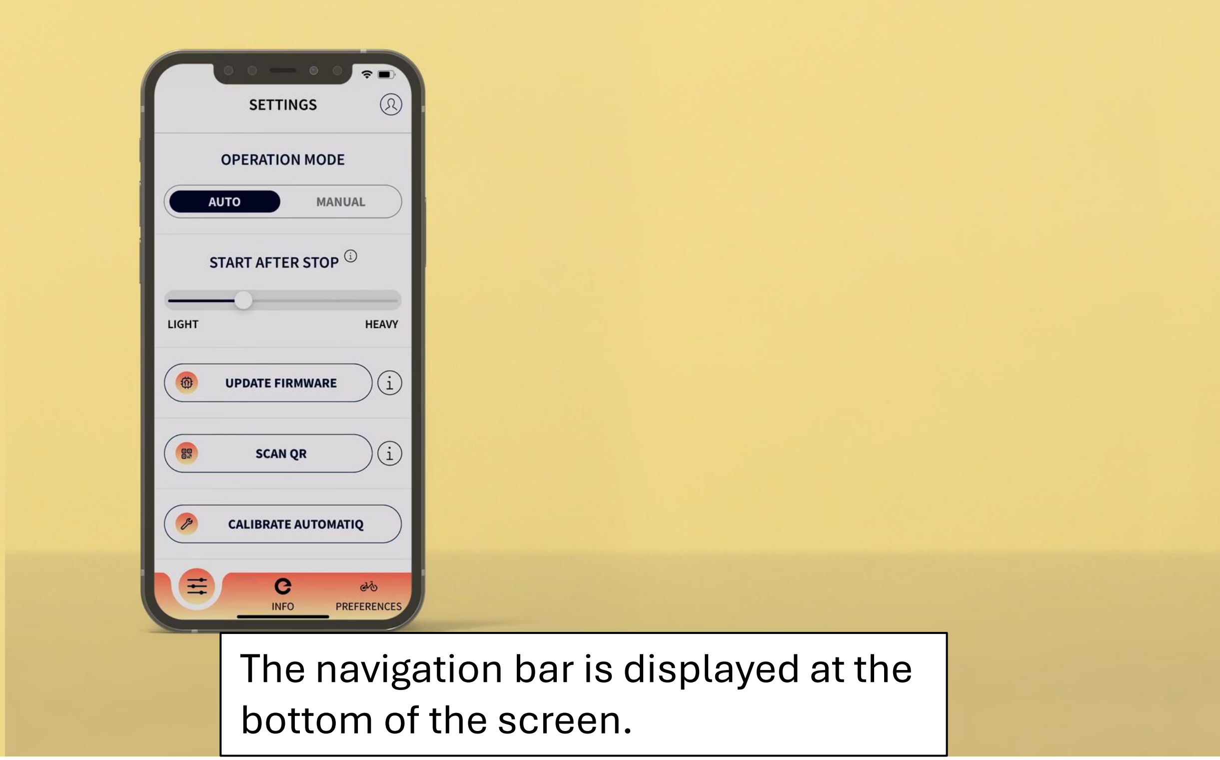
If multiple interfaces are found, ...

The interface with the highest number is the closest to you.

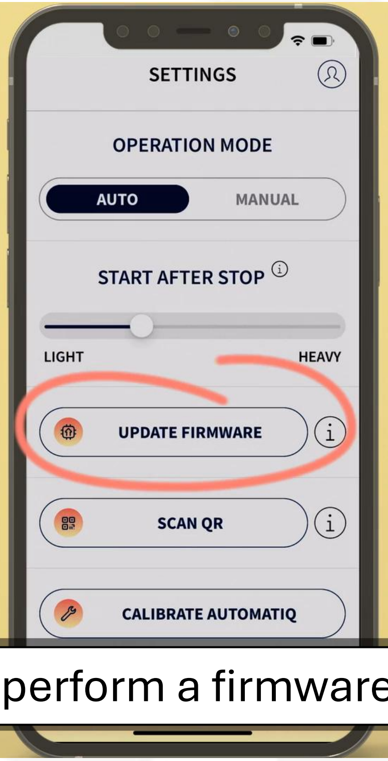


The interface with the highest number is the closest to you.

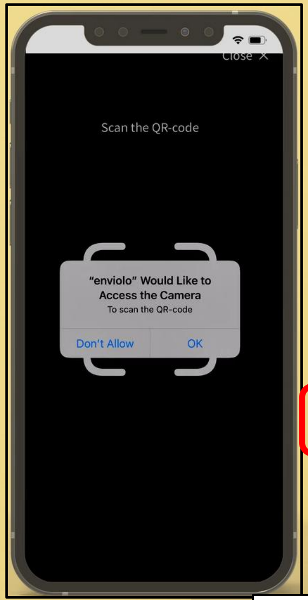
... select the correct number on the screen and confirm your entry.

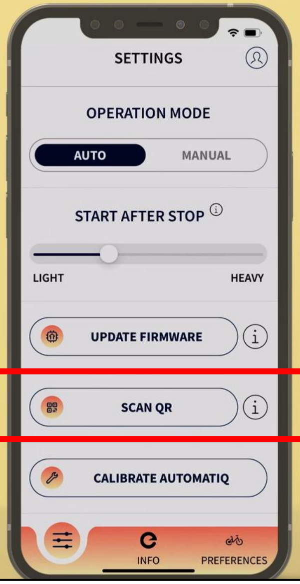


The navigation bar is displayed at the bottom of the screen.



Now perform a firmware update and transfer it.

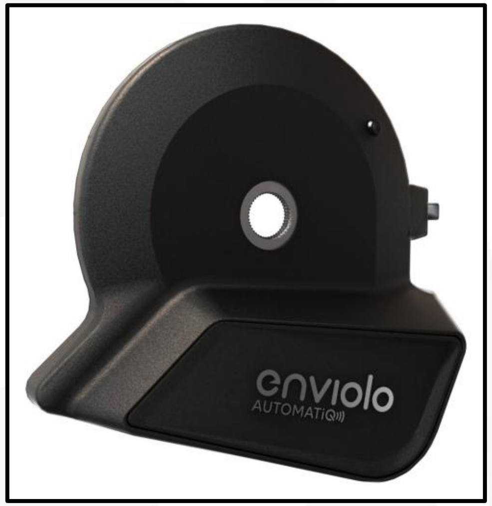


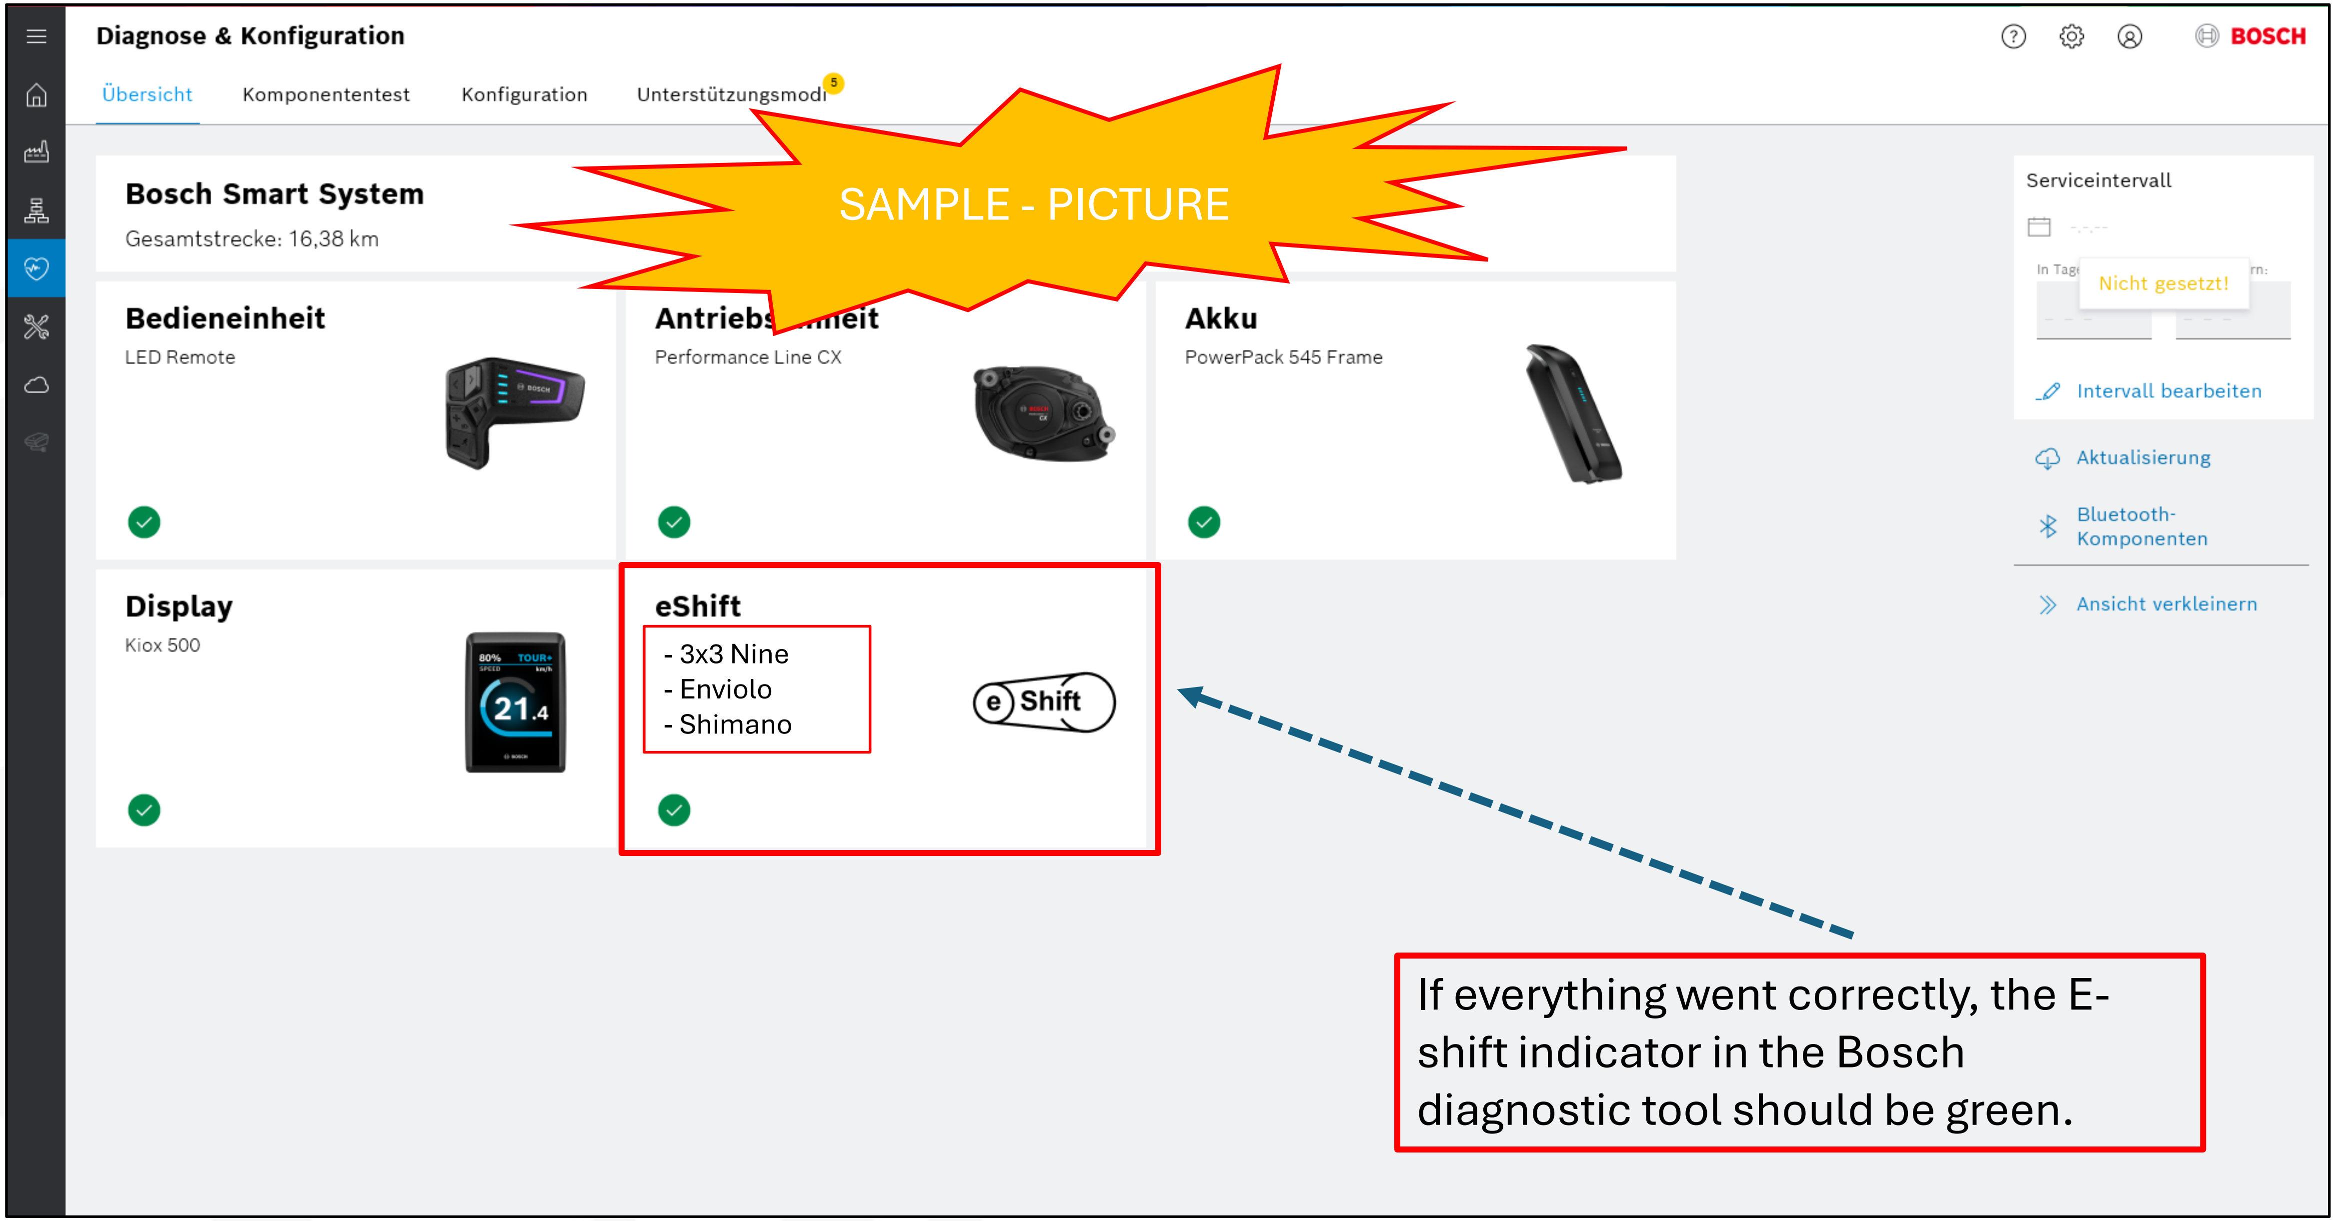


Then scan and transfer the QR code.

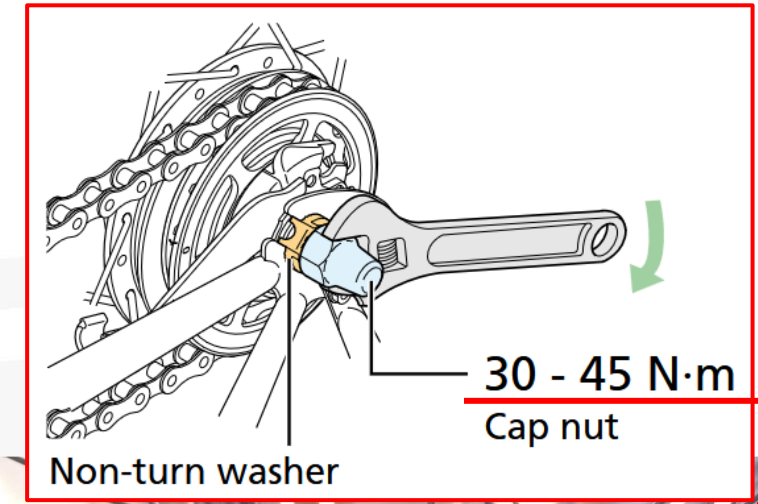
The QR code contains the important parameters so that the interface knows which transmission ratios to use.

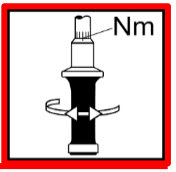
QR code for QiO Compact PAX+ MY26

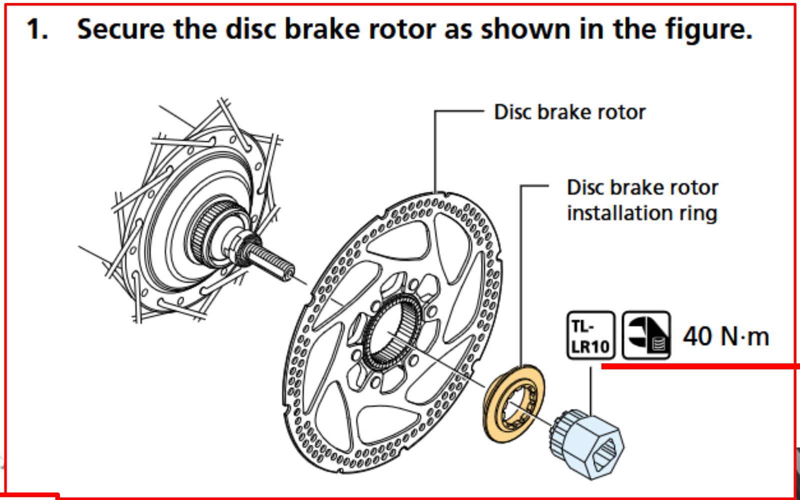


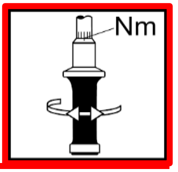


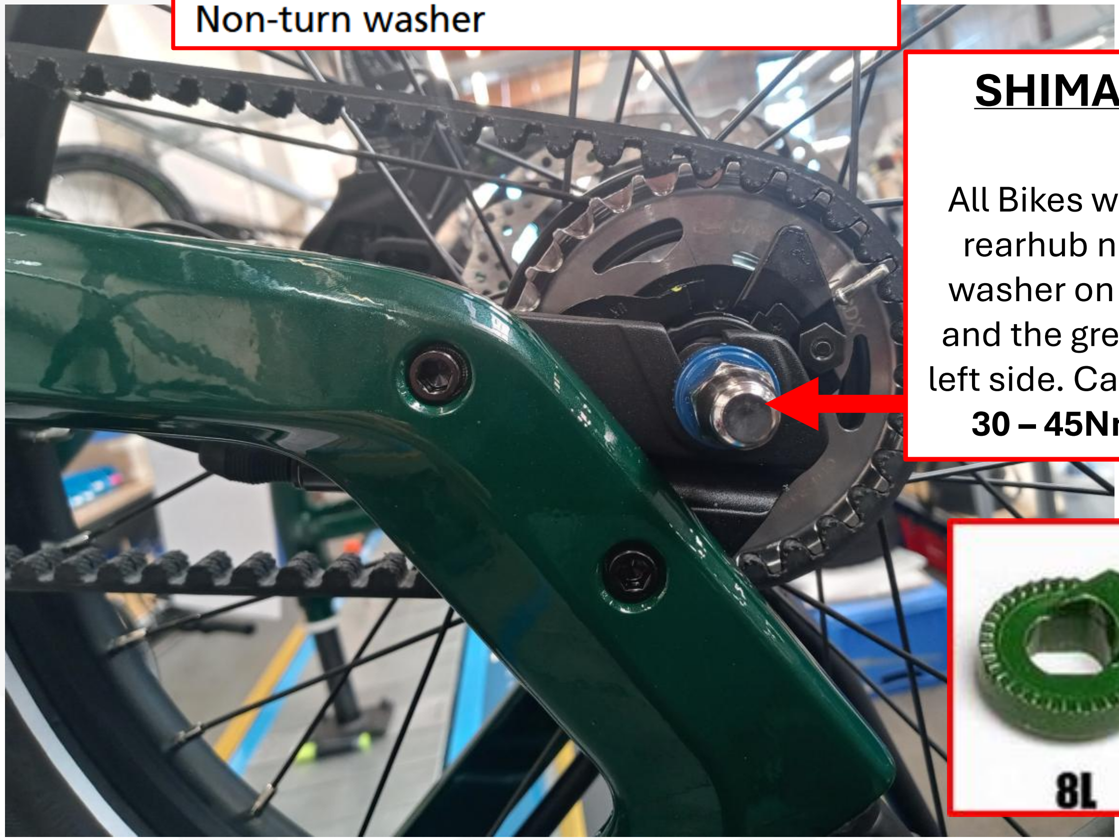
If everything went correctly, the E-shift indicator in the Bosch diagnostic tool should be green.











SHIMANO Nuts

All Bikes with SHIMANO rearhub need the blue washer on the right side and the green one on the left side. Cap Nut Torque = **30 – 45Nm** each side

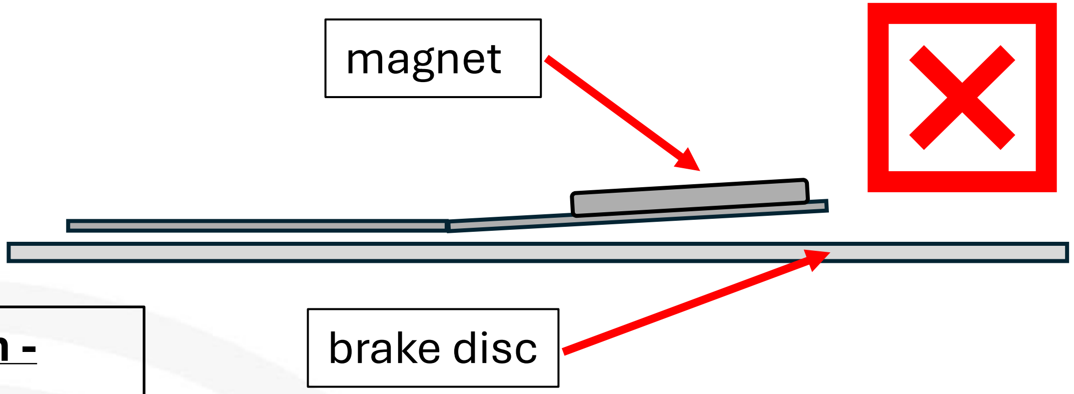
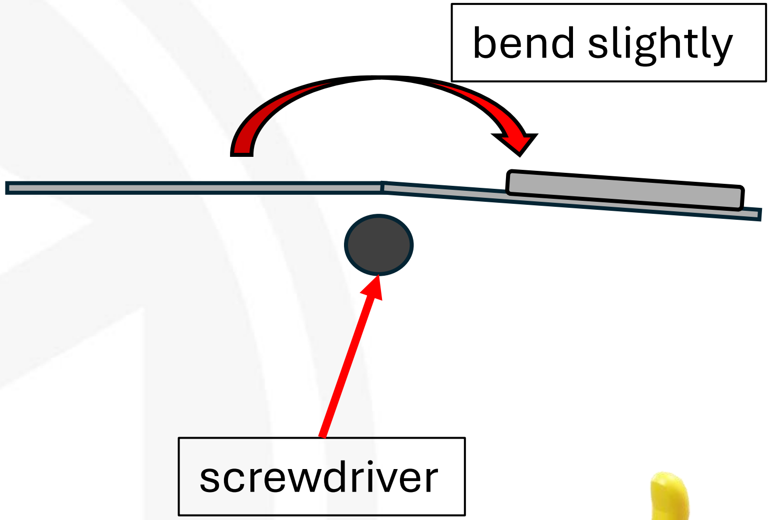
Magnet installation - brake disc

When installing the magnet, it may happen that it straightens up.

If this occurs, remove the magnet and bend it slightly in the opposite direction.





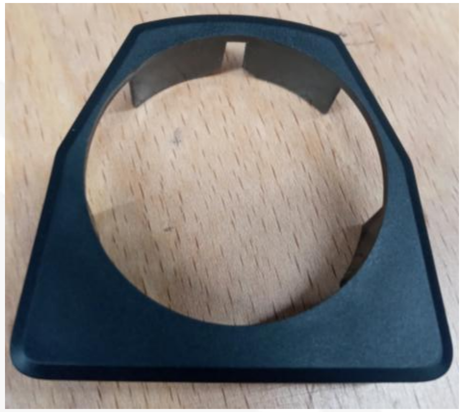
<u>Seat post assembly with anti-theft protection.</u>

All components of the seat post & assembly sequence

<u>Seat post assembly with anti-theft protection.</u>

old   new

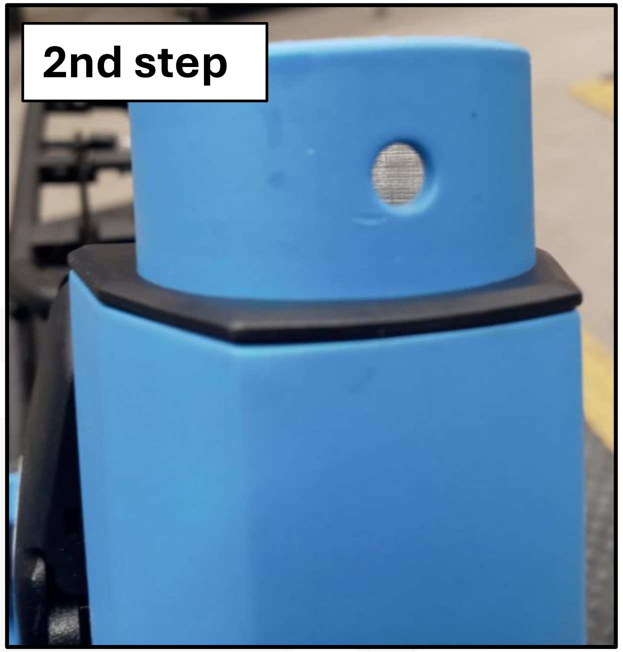
<u>Only use the new covers, the old ones do not fit the new frames.</u>

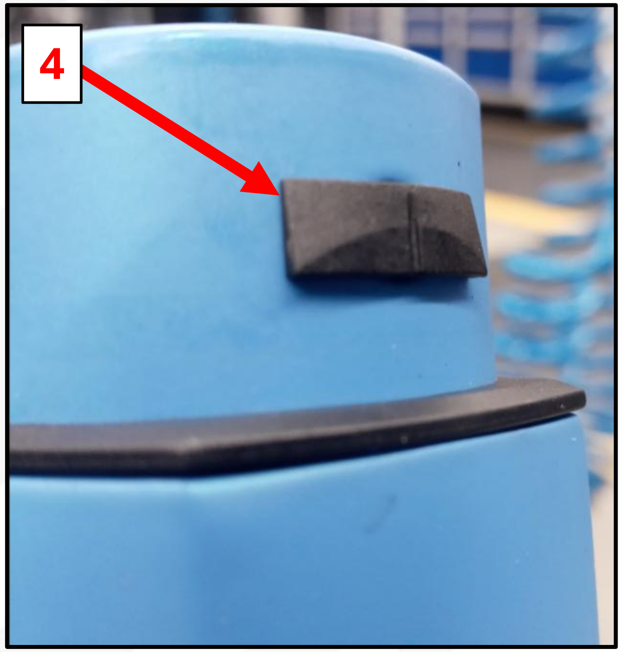


saftyclip

Seat post assembly with anti-theft protection.

Be aware not to damage the safety clip





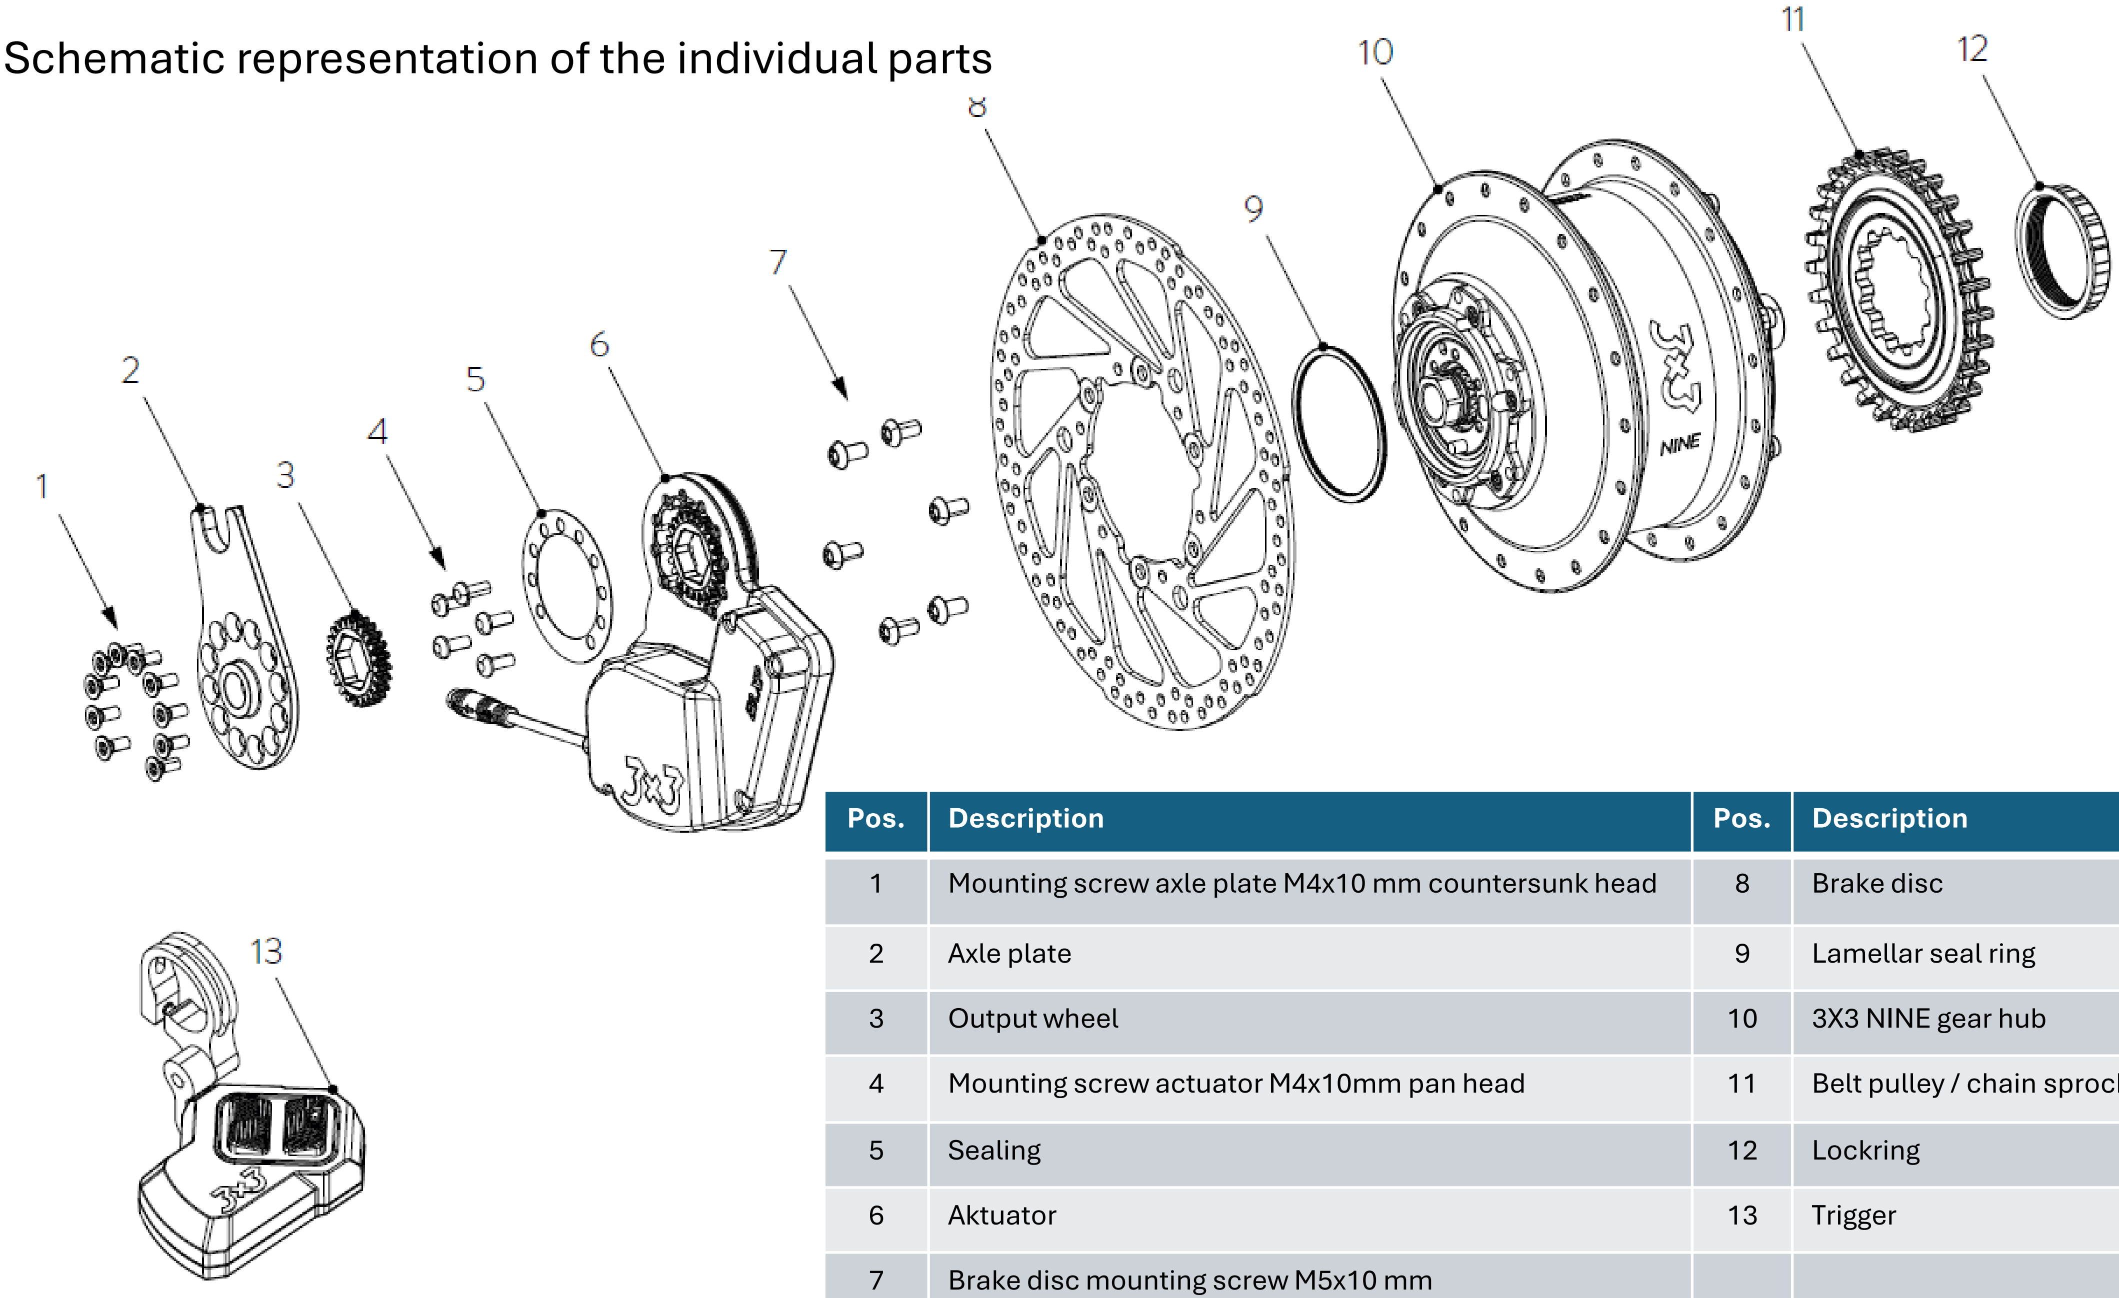
The long slot of the sleeve must align with the slot of the seat tube.

The seatpost clamp must be completely open in order to slide over the safety clip.

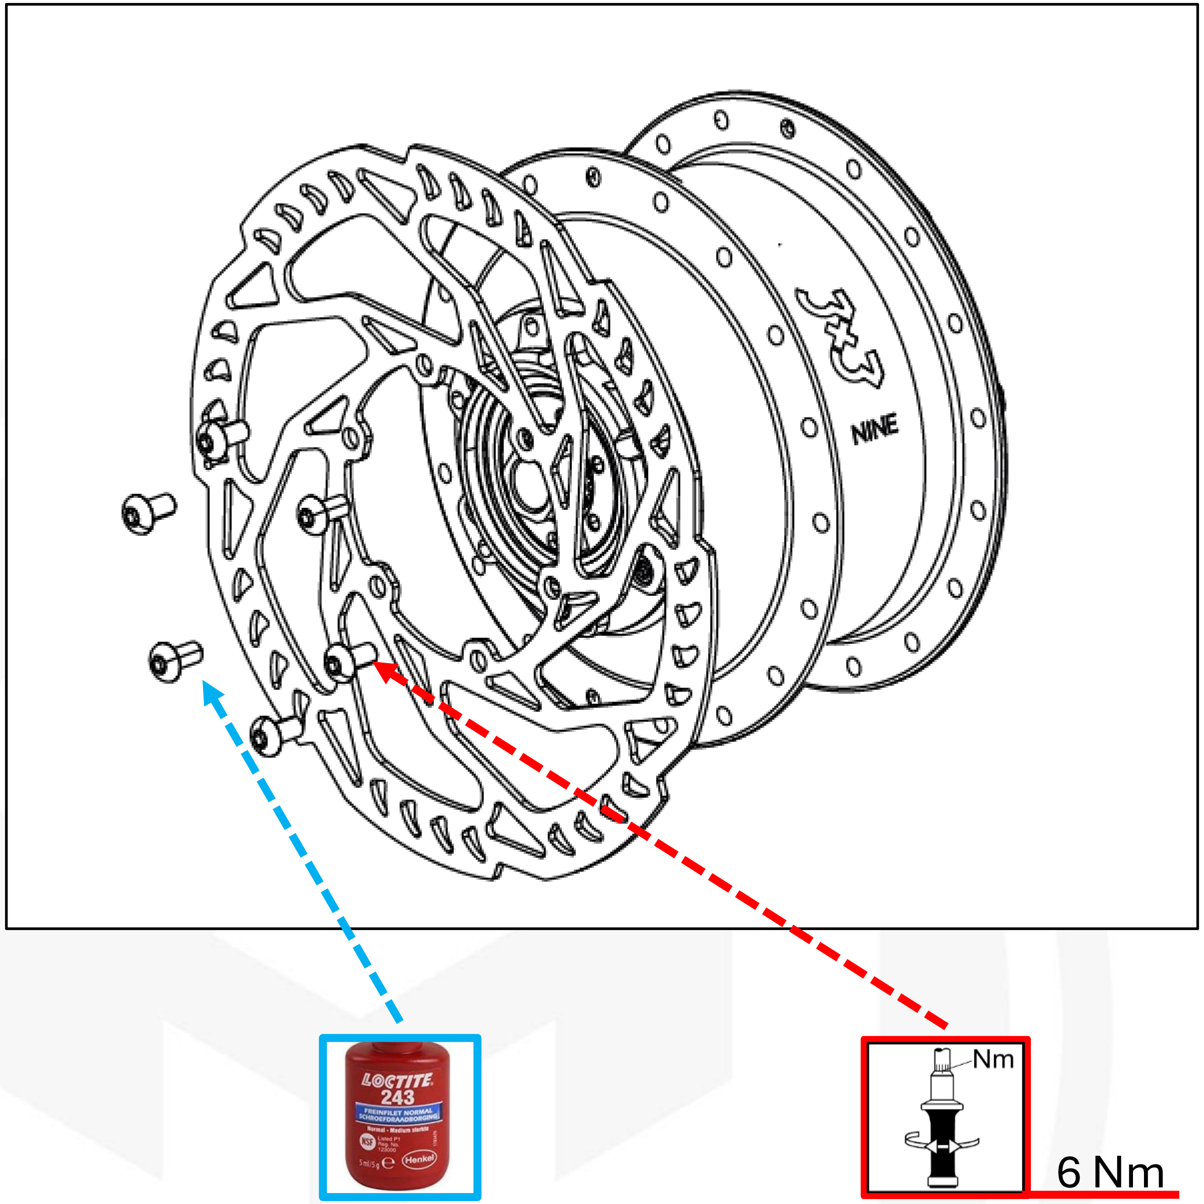
Seat post assembly with anti-theft protection.

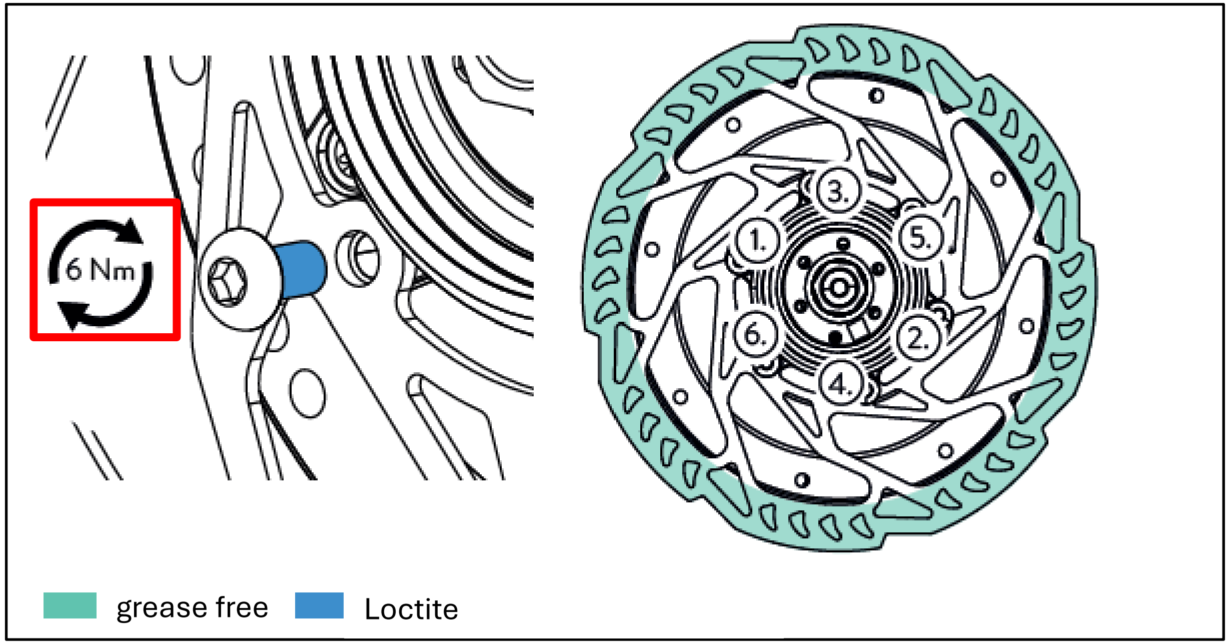
Now rotate the seat clamp 180° into position so that the open side is aligned with the slot in the seat tube. Be careful not to damage the safety clip inside the clamp.

Schematic representation of the individual parts



Pos.	Description	Pos.	Description
1	Mounting screw axle plate M4x10 mm countersunk head	8	Brake disc
2	Axle plate	9	Lamellar seal ring
3	Output wheel	10	3X3 NINE gear hub
4	Mounting screw actuator M4x10mm pan head	11	Belt pulley / chain sprocket
5	Sealing	12	Lockring
6	Aktuator	13	Trigger
7	Brake disc mounting screw M5x10 mm		





Installing the brake disc:

Only use original bolts. The bolt head height must not exceed 2.7 mm.

Place the disc with the bolts and tighten the bolts crosswise. Observe the torque specification.

The brake disc must already be installed before mounting the actuator.

1. Clean the contact surfaces of the actuator and hub.

2. Grease the groove of the sealing ring (1) and insert the sealing ring. Make sure that the overlaps do not cause any thickening.

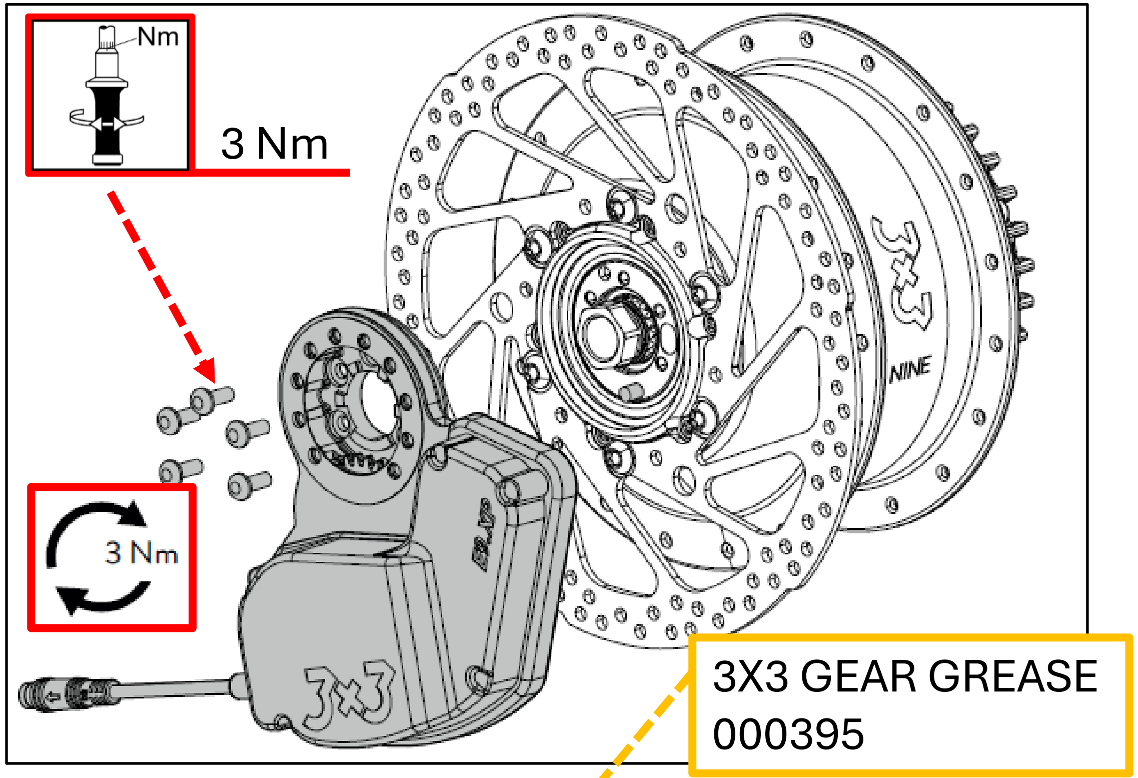
3. Check whether the screws are coated with threadlocker. Apply threadlocker if necessary.

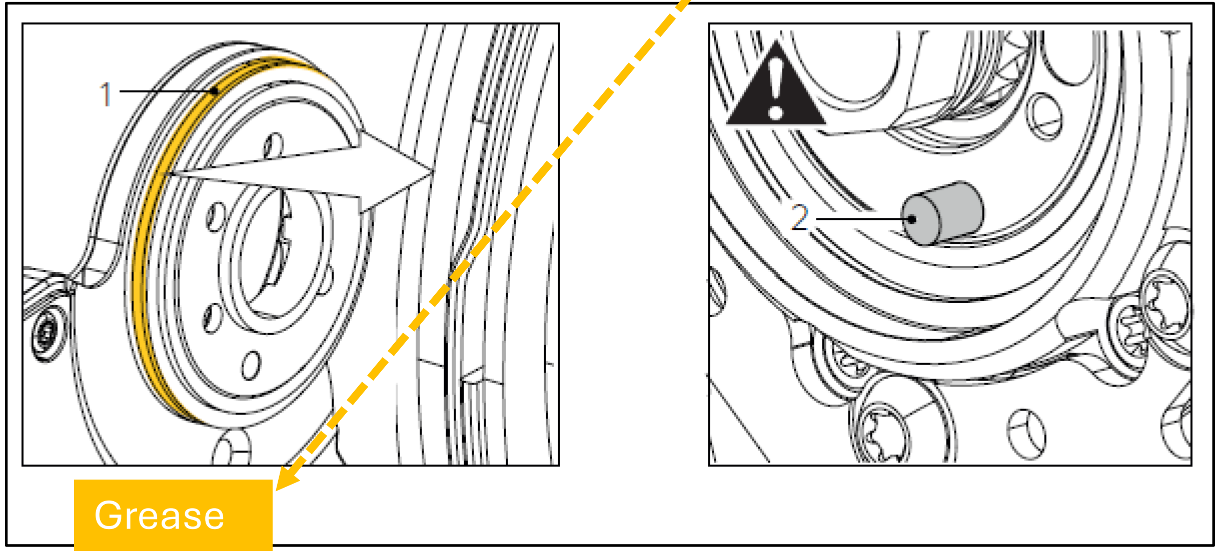
4. Place the actuator on the hub, thread the sealing ring into the housing so that it disappears completely, and tighten three of the five screws so that one hole between the screws remains free. The pin (2) of the main axis must be threaded into the hole provided for this purpose in the actuator.

5. Tighten the three screws slightly in a cross pattern and check that the actuator is sitting straight on thehub.

6. Insert the two missing screws and tighten all screws in a cross pattern with atorque of 3 Nm.

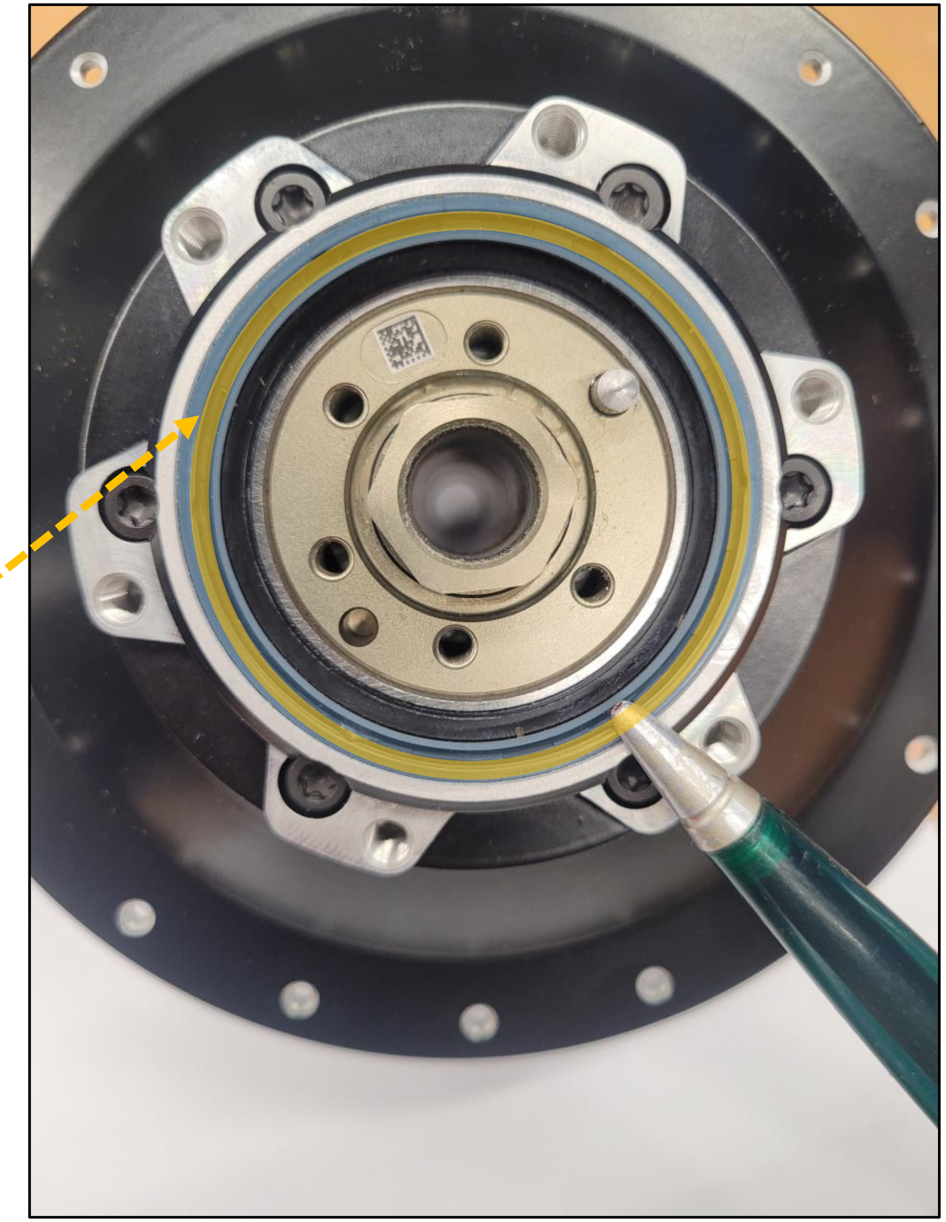
7. Check that the actuator moves freely.= The actuator must not collide with any other component during a 360° rotation.

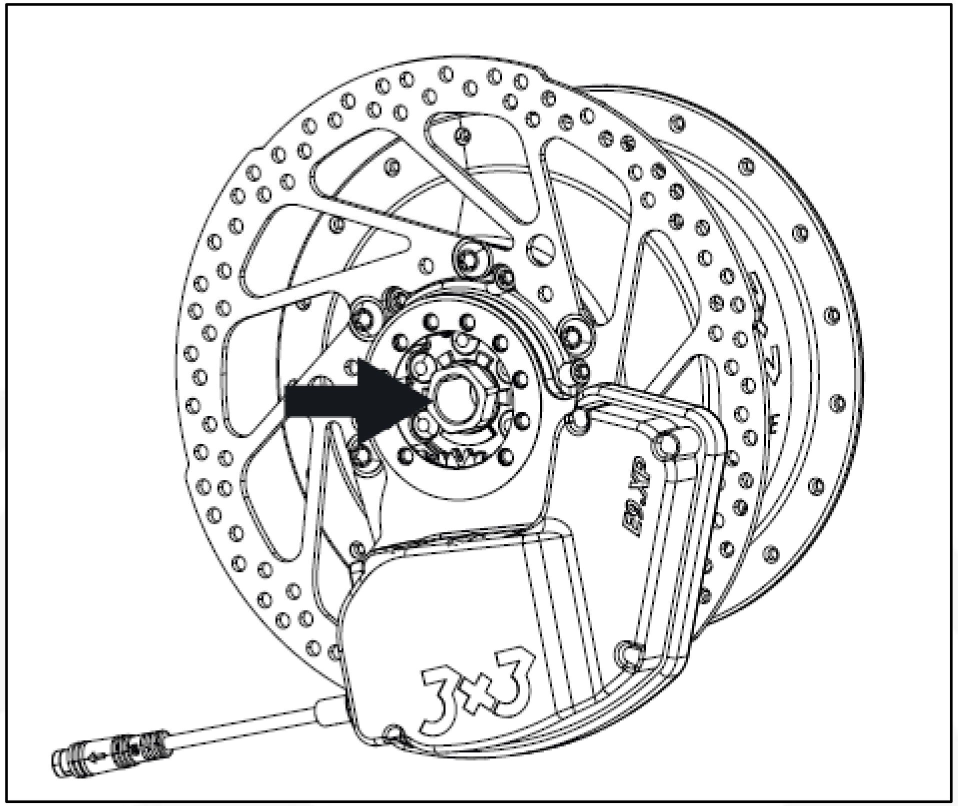




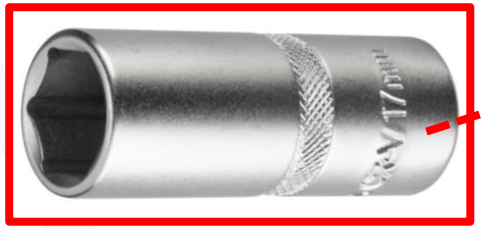
Lightly grease this area.

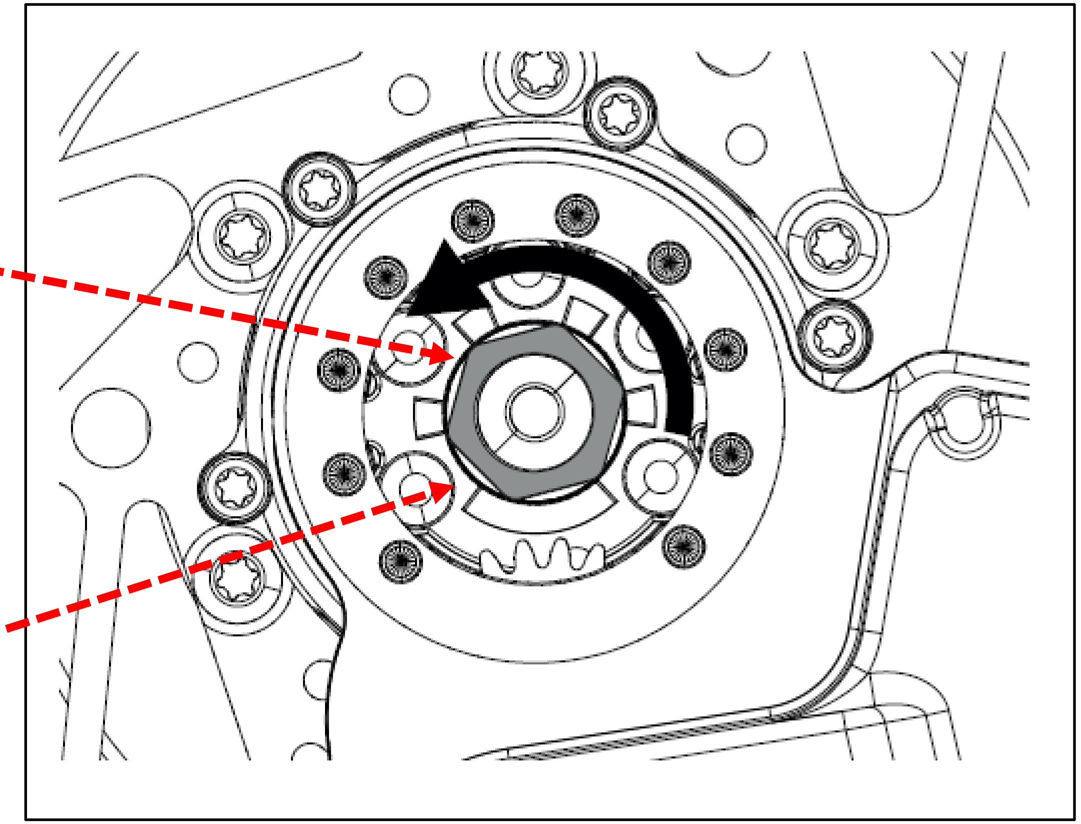
3X3 GEAR GREASE
000395





either/or





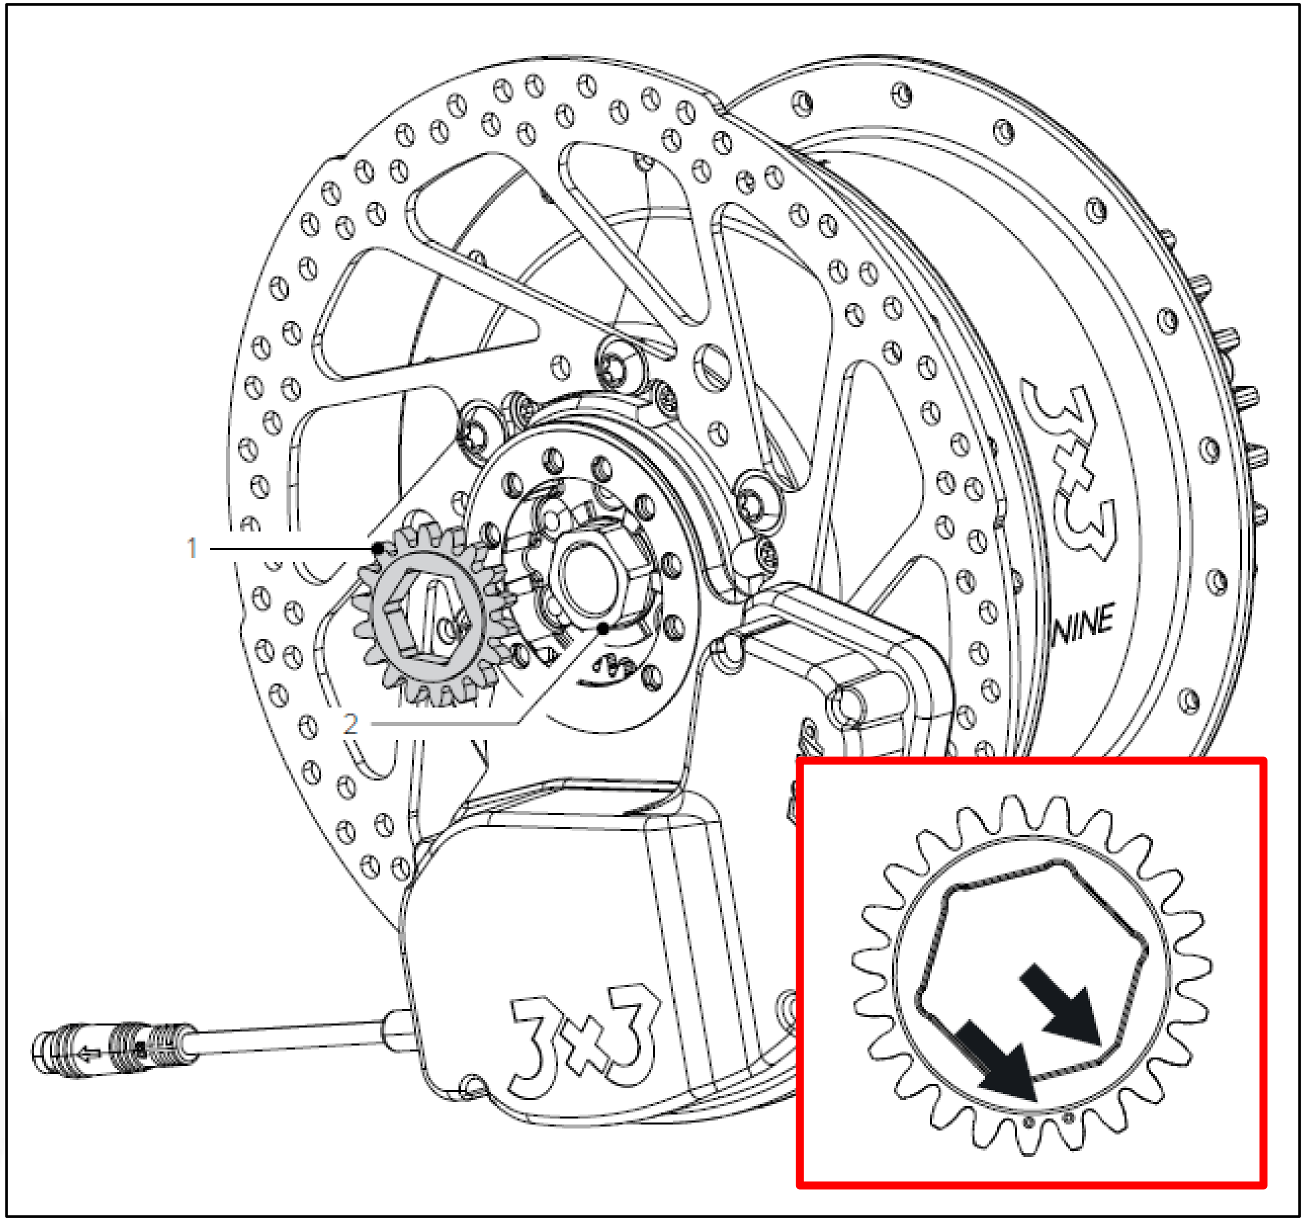
Turn the hexagon of the shift drum counterclockwise as far as it will go using a 17 mm socket wrench.

The hub is now in first gear.

Mounting the output wheel

1. Clean the output wheel (1) and the mounting surface.

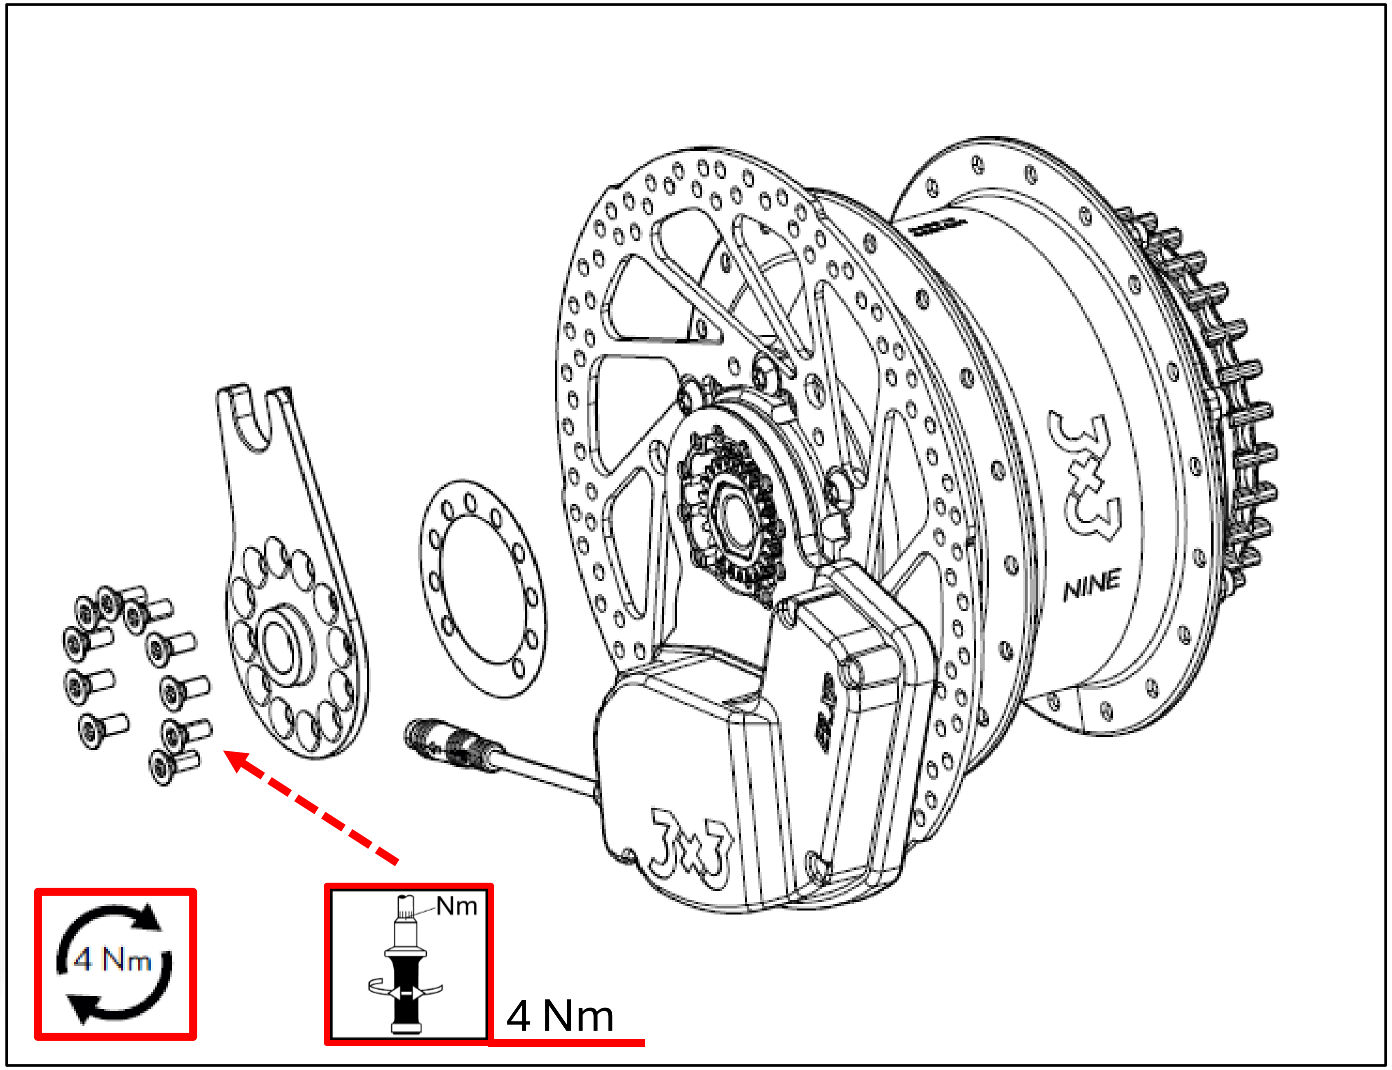
2. Place the output wheel (1) on the shift drum (2). The output wheel can only be inserted in a specific position (see the flattened area on the shift drum and the dots on the hexagonal gear wheel).



Mounting the axle plate

When aligning the axle plate, make sure that it fits the respective bicycle frame.

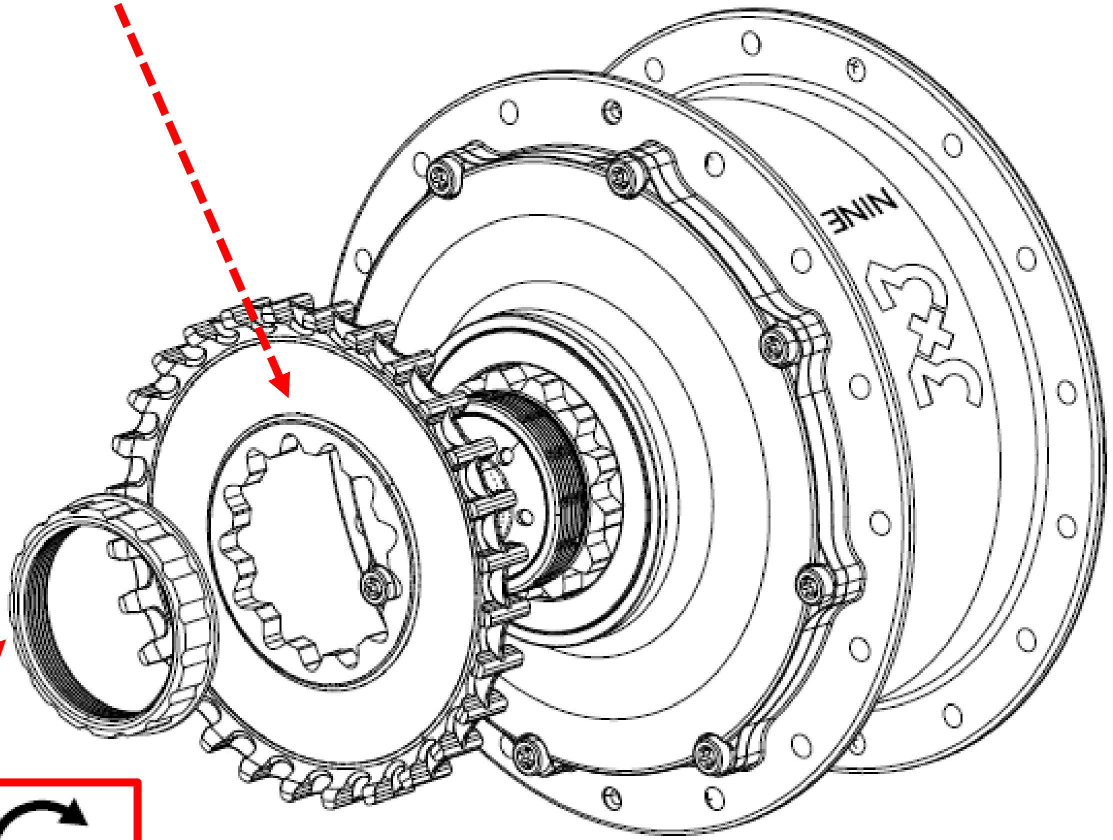
1. Place the paper gasket on the actuator. Align the paper gasket with the screw holes.
2. Place the appropriate axle plate on the actuator at the angle that matches your bicycle.
3. Apply medium-strength threadlocker to the screw threads.
4. Secure the actuator against twisting and tighten the screws crosswise with a torque of 4 Nm.

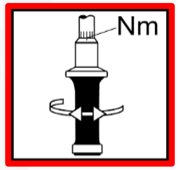


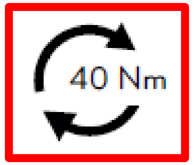
Mounting belt pulley / chain sprocket

1. Clean the hub driver and the sprocket or pulley.
2. Ensure that the seal carrier is fully inserted into the housing cover.
3. Slide the sprocket or pulley onto the hub driver.
4. Screw the lockring onto the driver.
5. Hold the sprocket with a chain whip or the pulley with a band wrench and tighten the lockring with a bottom bracket tool to 40 Nm.

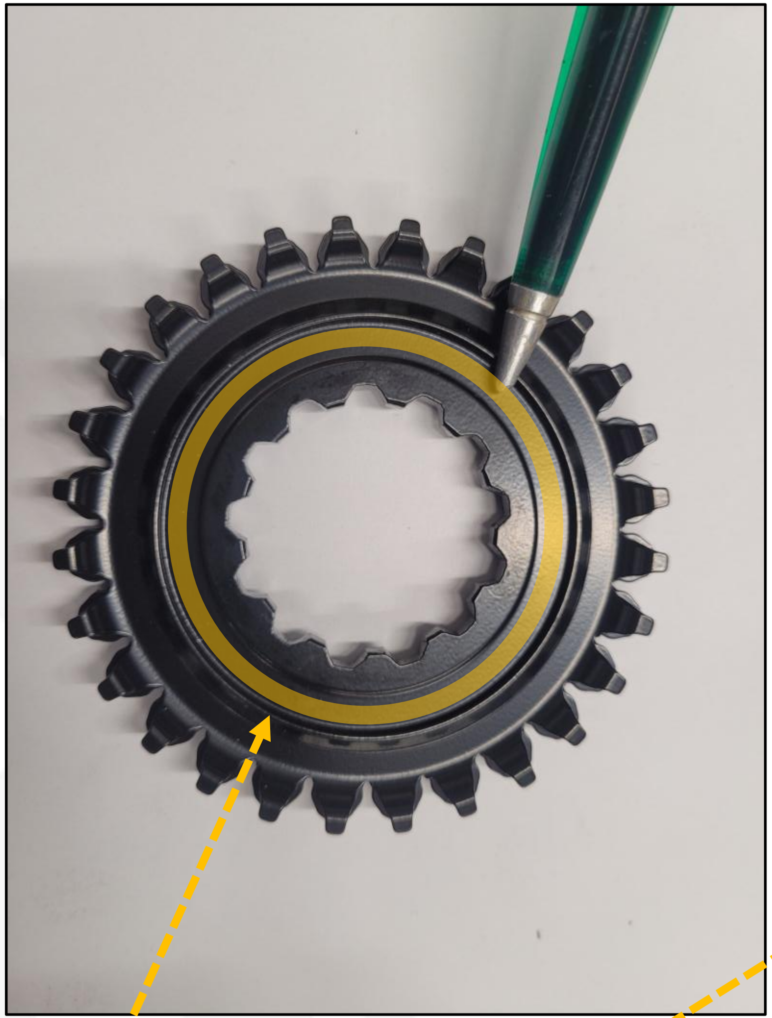
The markings on the belt sprocket face up.

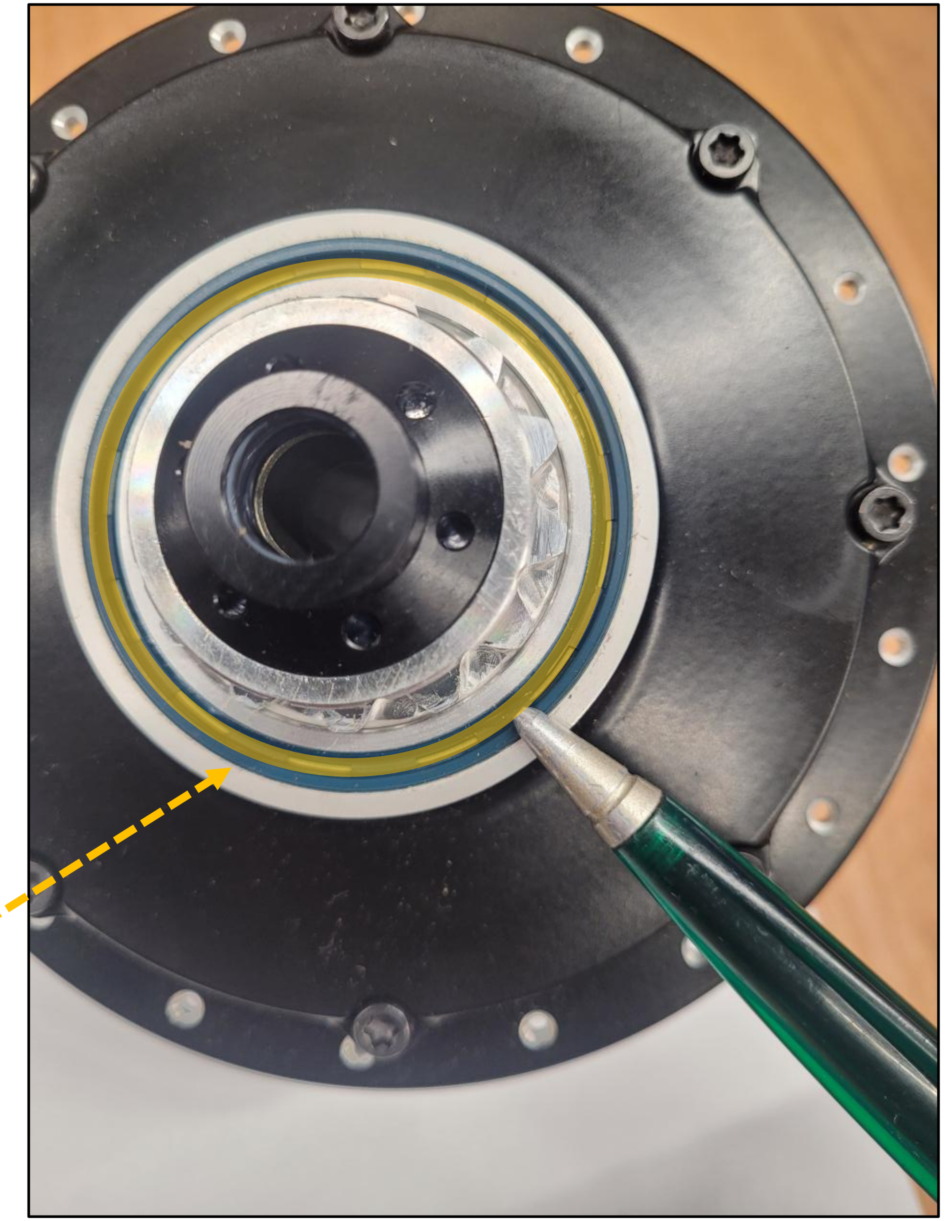




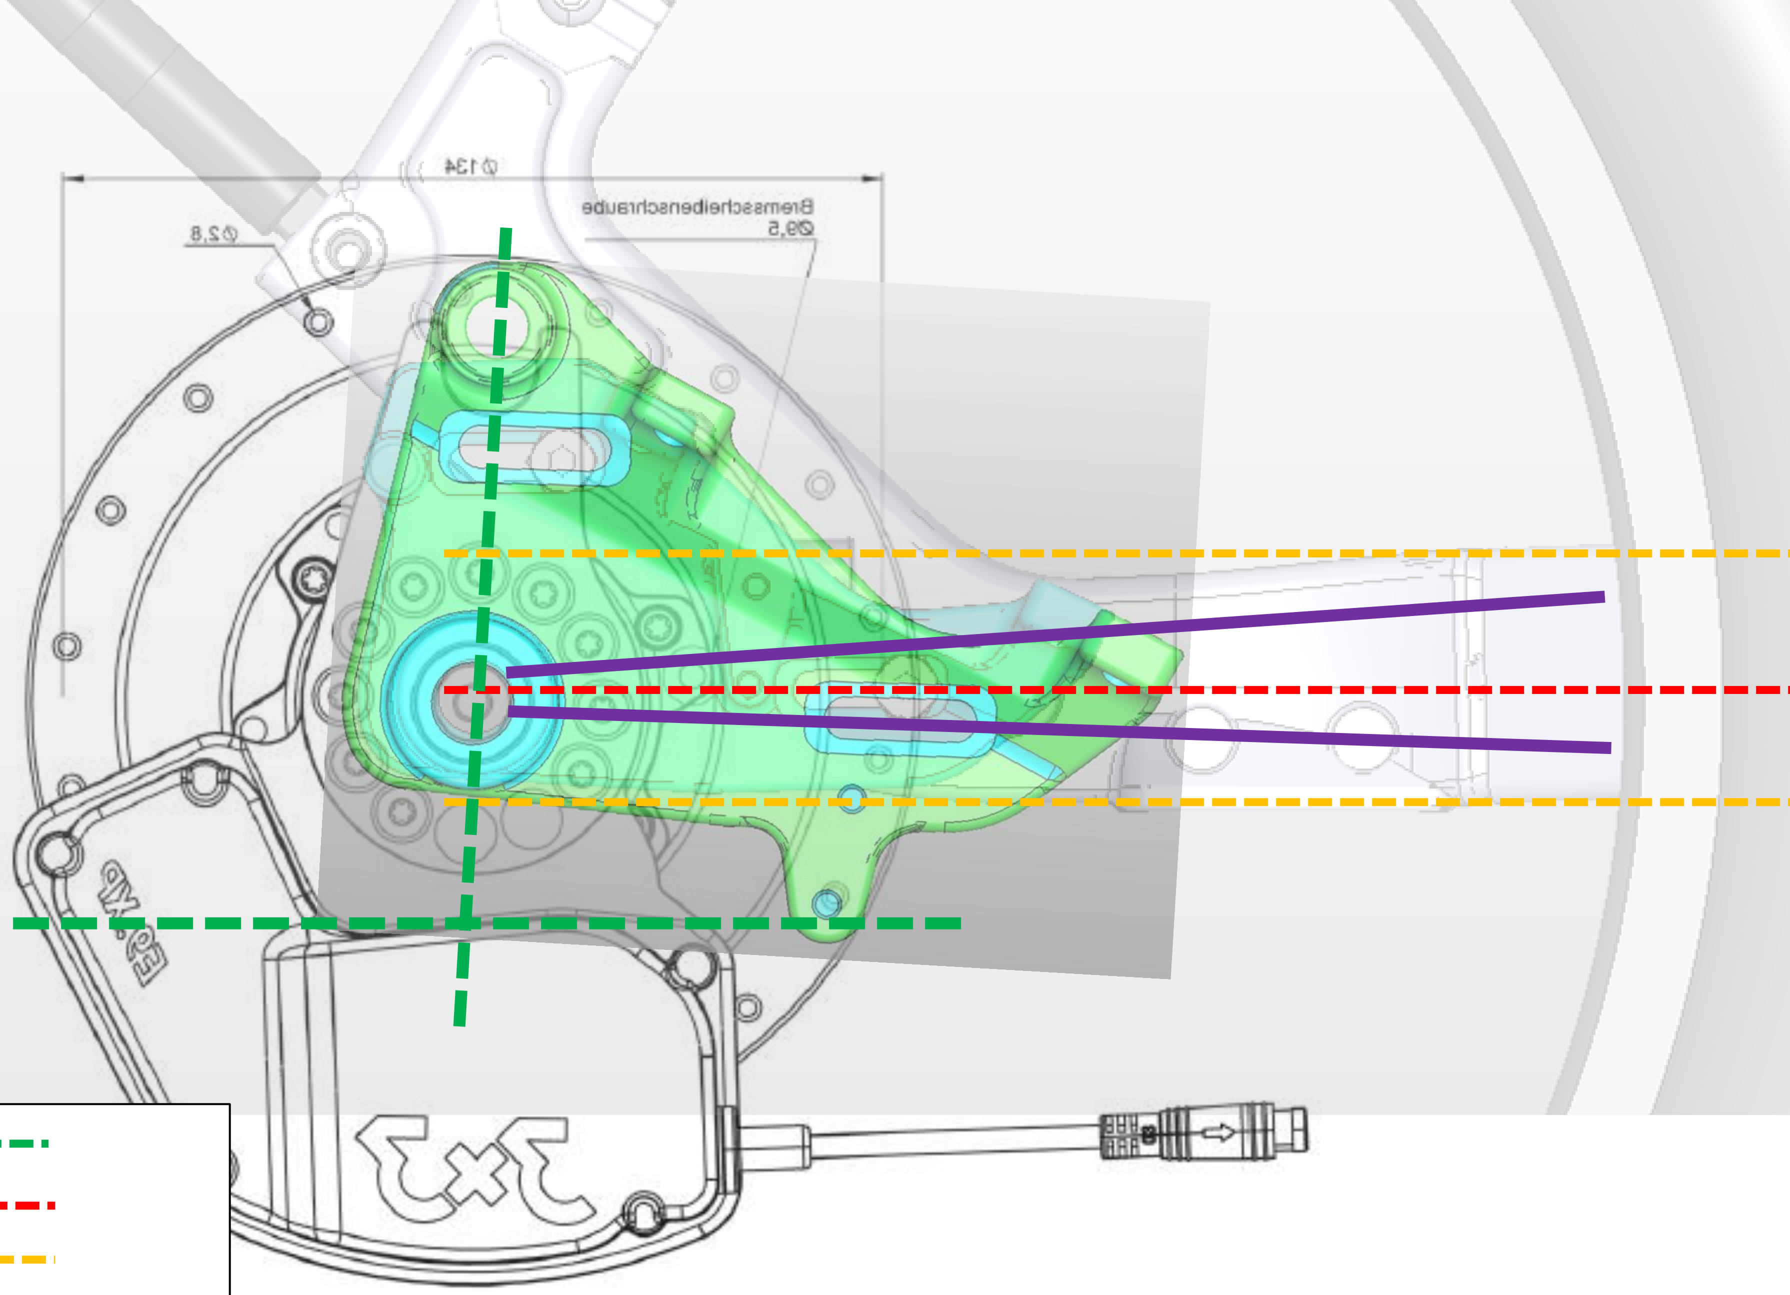


Lightly grease both pieces.





3X3 GEAR GREASE
000395

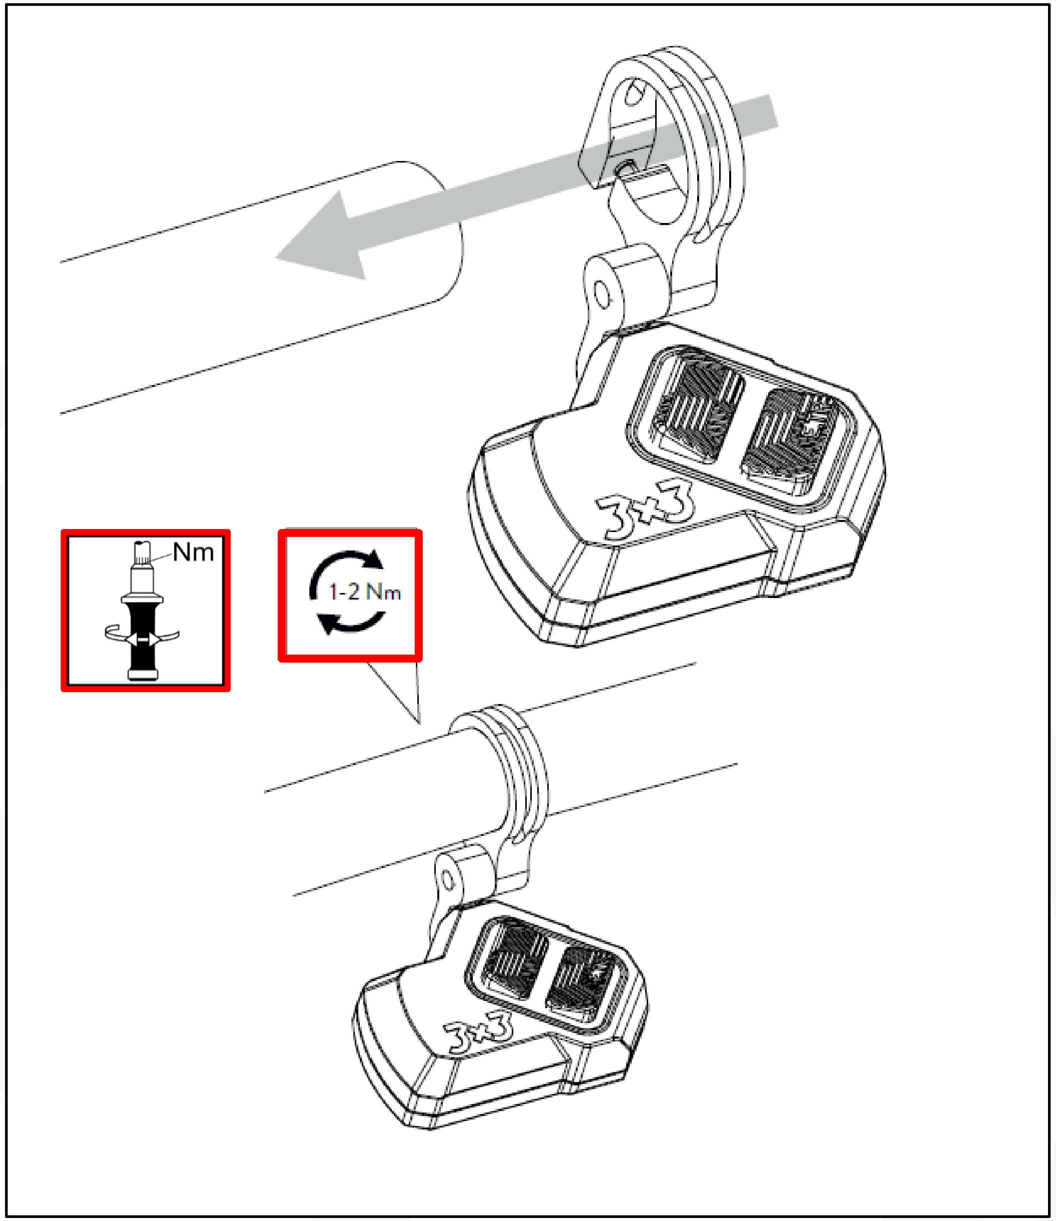


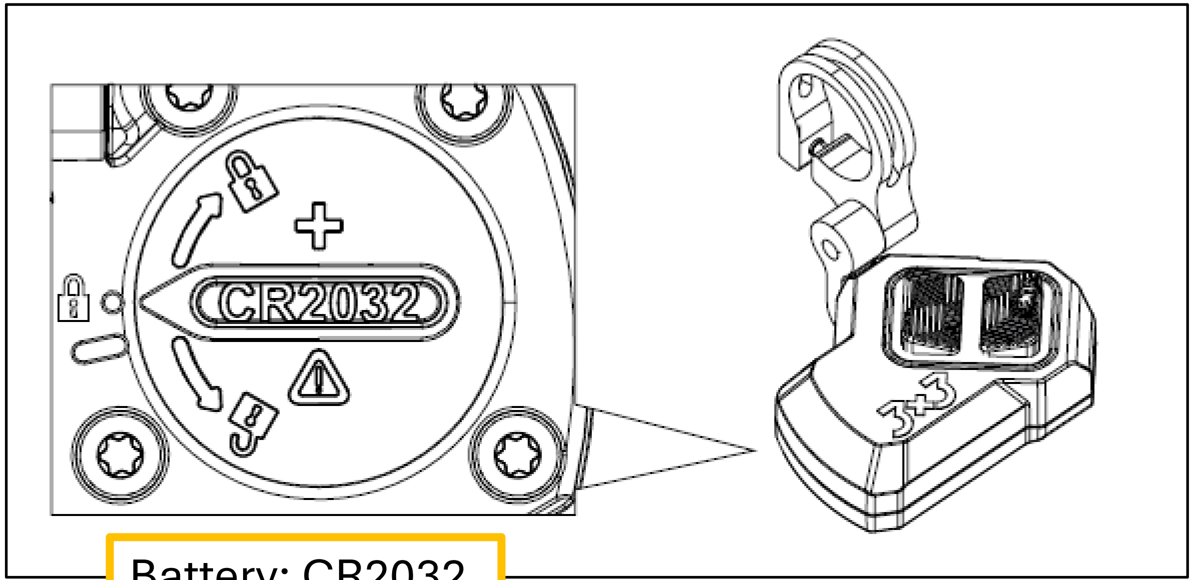
Angle of alignment

Center line

Chainstay area

Range of tolerance



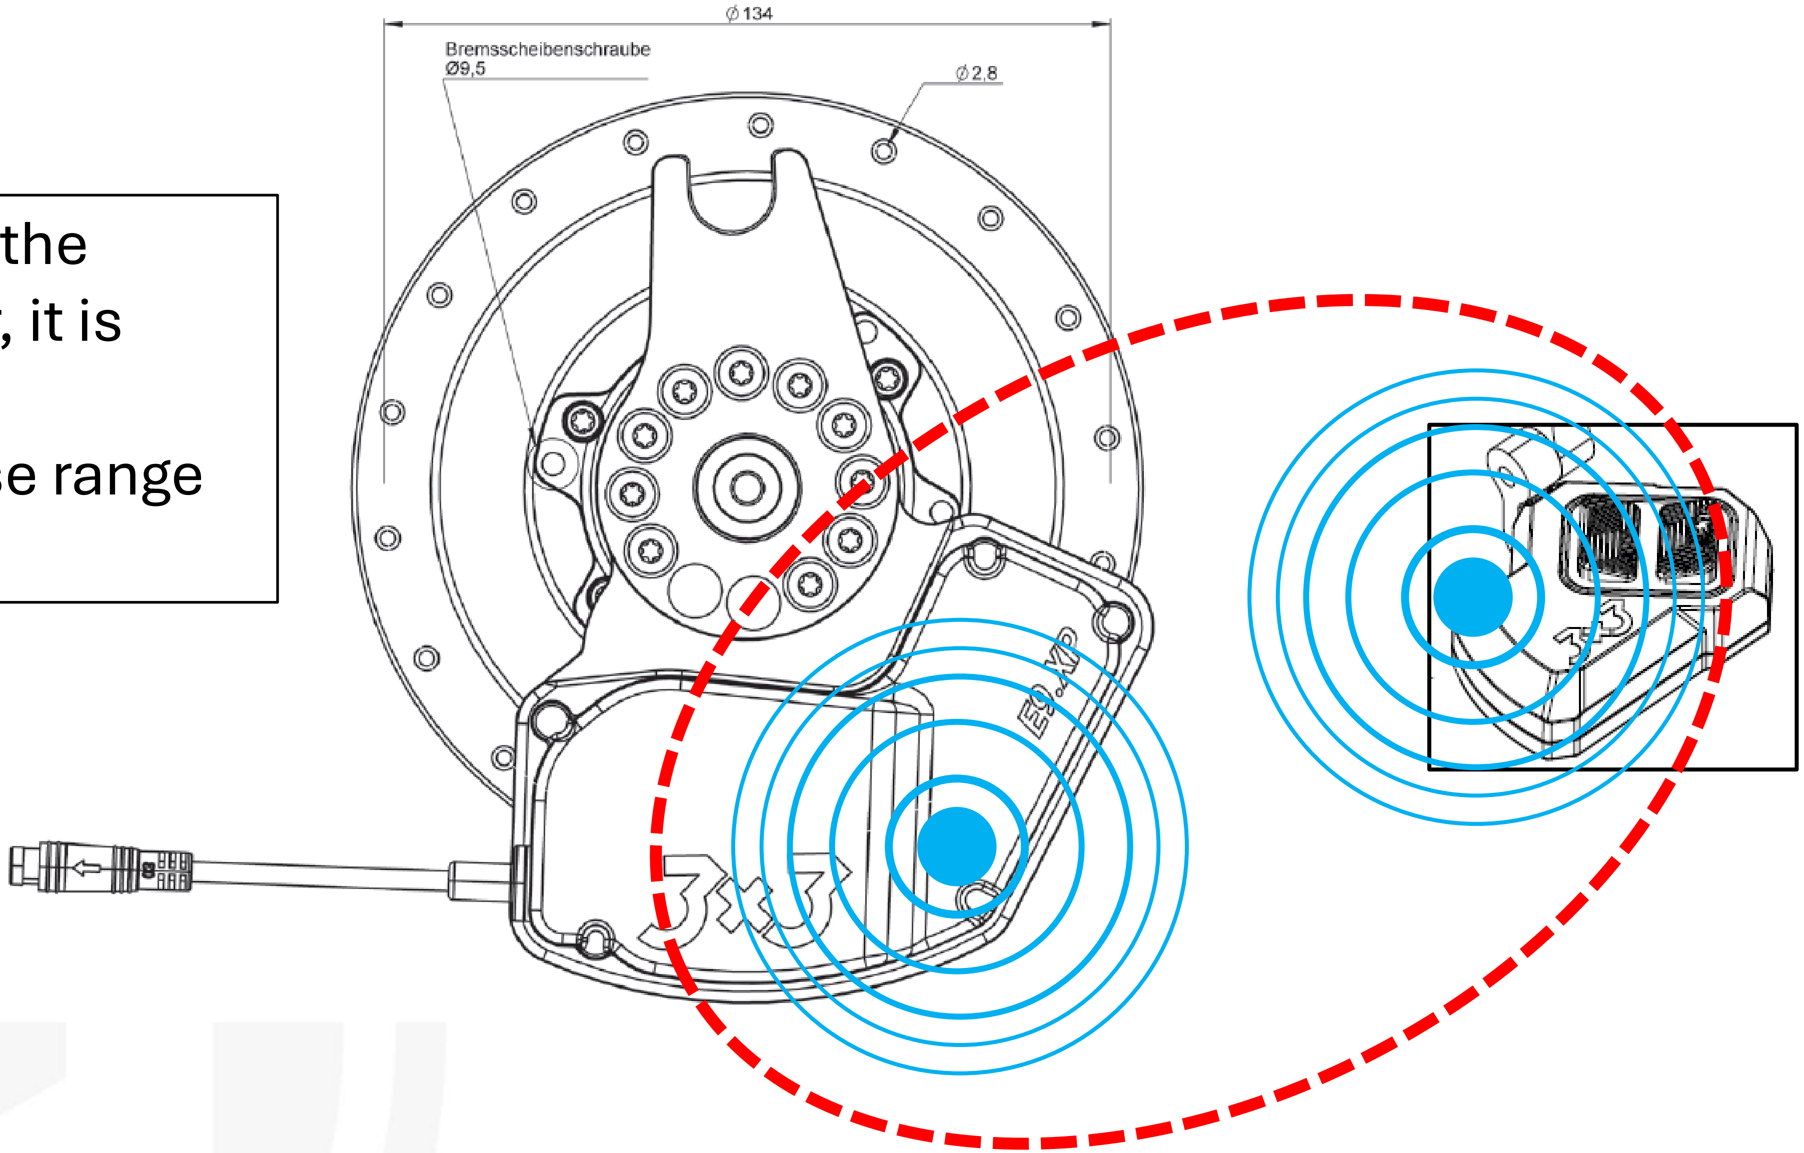


Battery: CR2032

Sometimes the battery may be too weak for the pairing process. If this happens, replace it.

Disconnect the trigger from the clamp and set it aside for pairing. Please refer to the next slide.

For the initial pairing of the actuator and the trigger, it is important that both components are in close range to each other.



Range: 30cm
